BUILD IT ONCE. BUILD IT RIGHT. BUILD IT WITH GALAXY.

If you're building a new generation of mission-critical applications, you need a tool with the power and scalability to span departments, divisions—the entire enterprise. Only one tool can help you do it all, because only one tool has it all—the Galaxy Application Environment® from Visix.

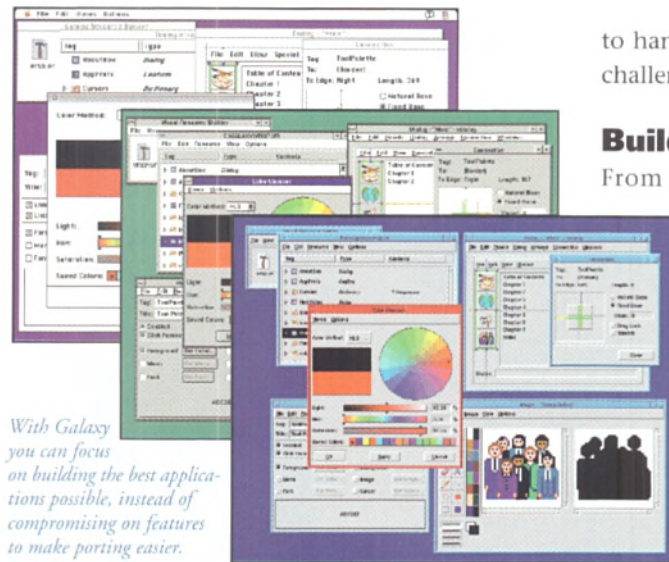

When we say "build it once, build it right," we mean it. Galaxy dramatically reduces both the time and cost of developing distributed, portable applications and significantly increases the quality of your final product. Only Galaxy can handle your toughest development challenges and then some—it's that good.

Galaxy's object-oriented architecture offers unprecedented API depth and breadth to liberate C and C++ developers from the constraints of platform-specific toolkits.

Build it once

Cross-platform no longer means compromise. With Galaxy's object-oriented API and integrated tools, your development team can write an entire application once and move it to UNIX, Windows, Windows NT, Macintosh, OS/2 and OpenVMS without changing a single line of code. You can easily support all your target platforms without struggling with multiple

With Galaxy you can focus on building the best applications possible, instead of compromising on features to make porting easier.

toolkits or supporting separate development teams. Best of all, there's no "least common denominator" effect with Galaxy—your applications are completely portable and still able to exploit the advanced capabilities of each native environment. The end result? You'll have a better application that is completely portable in a fraction of the time it would take otherwise.

Build it right

You'll build it right because we've built it right. Galaxy specifically targets the needs of high-end professional developers by providing a comprehensive set of object-oriented libraries, distributed services, and visual tools into a cohesive, multiplatform development environment. Galaxy not only provides a powerful GUI builder, but also includes a rich set of platform-independent abstractions—such as memory management, networking, file management, and distributed services—

to handle the other 50% of your most challenging development projects.

Build it with Galaxy

From financial services to manufacturing, Galaxy has exceeded the expectations of even the most demanding developers and won the praises of the computer industry press and analysts. Galaxy architecture has proven itself in hundreds of real world environments—J.P. Morgan, Xerox, IBM, Legent, and many others are using Galaxy today to build their mission-critical applications.

"The best cross-platform generator that we saw."

COMMENT

Soap Flakes3

How dynamic data visualisation brings complexity under control. Plus: is Warp a viable development target?

Mayhem4

Introducing, for your entertainment and delight, Kinetico the Stupendous - erm, ShuffleBot the barely plausible - erm, well, judge for yourself. Jules May has been inventing weird things again.

NEWS

News Review6

Report from the EXE Show. Smalltalk on the move. BT's vision of the future.

Products News8

The heat behind HotJava. DLLs in VB. API extensions for OS/2 Warp. A new version of Codewright, the programmers' editor.

Letters13

LZW patenteese, the joystick fire buttons and how language bugs are treated.

REVIEWS

In leaps and bounds49

When developing in Windows, it helps to have a debugger that pulls its weight. Colin Smith takes the Bounds Checker penguin on a bug hunt.

Creating Windows DLLs using only Basic59

Have you ever wanted to create a Windows DLL from within the Basic language? Robert Stimpson found two approaches without having to resort to C.

Books64

Efficient C/C++ Programming, an indispensable cookbook for the art of real-world efficient C/C++ programs, reviewed by Bob Swart.

FEATURES

Wireless & wired15

Wireless mobile phones and laptop computers now can be connected. David Mery shows how to take advantage of the combination of the two.

Extended stored procedures for SQL Server23

Microsoft SQL Server now lets you go a long way beyond standard SQL syntax. Mike Campbell explains how it is even possible to reach the Win32 API.

TECHNIQUES

HyperText Markup Language 3.029

The evolution of HTML has been led by Web site developers. HTML 3.0 is the proposed new version that incorporates many of the features that they have requested. Paul Richardson tries them out.

All about processes... well nearly37

The only certainties are birth, death and being a zombie... Peter Collinson takes us through the highlights of the life of the humble process, showing how it has changed as UNIX itself has evolved.

It's time to write of many things45

Francis Glassborow brings a new eclectic approach to his column, including a spot-the-mistake quiz and an introduction to smart pointers.

News & Views

C-Vision for C/C++ 4.0 from Gimpel

This is a set of tools to help programmers analyse, understand, document and maintain C & C++ source code. It includes:

A cross-referencer that produces a list of symbols enhanced with usage (definition, declaration, assignment, address of) and type information (including function prototypes & templates). All symbols, including macros, types, templates and members can be included in the cross-reference.

A tree diagrammer provides trees of function call graphs or class hierarchies, with numerous pruning options. Both cross-reference & tree information can be dumped in ASCII for importing to a database. You can have up to 4 Mbytes of symbols.

A source code reformatter lets you put code into a consistent style, with complete control over indentation, and alignment of multi-line comments.

An intelligent source code lister produces outlined source listings to graphically show program logic.

Available for DOS or OS/2 at only £145. Call us for further details.

PC-Lint for C/C++ 6.0 from Gimpel

This is not a new tool, but is from the same company as C-Vision and will appeal to a similar audience.

"C++ is one of the most grotesque and cryptic programming languages ever created"

Ray Duncan

It is also one of the most complex. If you think you are a C++ expert, then you probably aren't! Yet it is one of the most widely used languages, and the only realistic choice for many applications. You need all the help you can get.

PC-Lint for C/C++ will analyse a mixed suite of C and C++ modules and produce a wide variety of warning and error messages. This static analysis can turn up bugs before you even run the program! If it finds just one bug, it will have paid for itself.

Call us now for full details. Only £139.

SoapFlakes

Mimicking reality

ONCE HEARD a lovely story about a carefully constructed computer program designed to calculate the timing for automatic release of a bomb from a fighter aircraft. The computer was accurately programmed to assess the plane's speed and altitude and the distance to the target. Unfortunately, the program listing and the alpha numeric table of results failed to alert the system designer to a potentially fatal oversight. The way the program was written, the aircraft would release its lethal cargo even if, at the moment it passed over the point when the bomb should be released, the pilot was flying upside down.

One picture would have immediately alerted of the danger. Had the application been developed, tested and implemented using an animated, graphical representation of the aircraft in flight, the problem would have been transparently obvious.

The ability of the brain to recognise visual patterns and detect even subtle changes is quite astonishing. In spite of this fact, many critical computer applications still present users with textual output or complex tables of figures which are extremely difficult to read or understand. The problem is exacerbated by the fact that the critical time when we really need clear, concise information is at moments when we are under greatest stress - when a patient goes into trauma, when customers complain that the communications network is down, when a power reactor shuts down or when a component fails in a vital production process. On such occasions, we are least prepared to wade calmly through tables of figures and rationally interpret figures and text to find out what has gone wrong.

Even where graphic or pictorial diagrams are available, they are usually confined to simple line graphs, bar charts or textual displays depicting static data collected at one historical moment in time. In real-life situations - whether controlling a process plant or monitoring vehicle movements in air, space or on the ground - a continuous data feed from sensors, equipment and other component devices is generally available to advise of all changes in status, performance and loading. To be fully effective in monitoring and managing critical

processes, graphic systems need to be capable of interacting with these data sources to reflect the dynamic nature of the environments in real time.

One technique which achieves this is the use of the synoptic display or mimic diagram - animated simulations that project the behaviour of graphic objects within a visual representation of their environment. Synoptic diagrams provide a powerful and intuitive method of displaying and interpreting complex data and they are growing in popularity as the price/performance ratio of hardware capable of handling the graphics processing has come down.

We need to make the computer work harder to present information in a visual form that human engineers and managers can more easily understand and interpret. We need to stop trying to force the human mind to work like a computer, juggling huge tables of digital information.

*John Massey, Managing Director
of Tenet Systems Limited*

The Warp factor

IT'S RATHER POINTLESS comparing Windows with OS/2 Warp. Pointless because Windows 3.x has an installed base of 70 million users and OS/2, well, doesn't.

But there is a flip side to this from a developer's point of view. The Windows market is pretty much wrapped up. There is no point launching another word processor, spreadsheet or any mainstream application, because however good it is, you aren't going to get anywhere without, for starters, a Microsoft-sized marketing budget is behind you.

Warp, on the other hand, is different. The user base may not be Windows-gargantuan but, according to IBM, Warp is selling: half a million copies in the first 60 days. According to John Thompson, IBM's general manager for marketing and solution developer programmes, the market for native Warp applications is worth around \$9 billion and growing. There should be enough to satisfy the appetites of a generation of disillusioned Windows 3.x programmers.

IBM desperately needs more Warp developers, and is working hard to court the developer community. To allow Win32 developers to be able to port their applications to OS/2 with minimal effort, it has created an extended Warp API which permits

80% common application code between the two platforms. Naturally, one remains suspicious about the 20% remaining, but the Developer API Extensions should act as an added incentive to coax Windows developers to move their applications to Warp.

Who are these users who are gasping for Warp apps? There seem to be two very different types. There is the corporate buyer - IBM's natural constituency - who wants solid, no-frills, proven technology that's scalable throughout the enterprise and is going to be around in five year's time. On the other hand, Warp is being pushed into the home as a zany, trend-setting, multimedia platform for people who want to try something that's **not** Windows.

By targeting the home user, IBM risks alienating its dedicated corporate stronghold. But to the developer, Warp in the home is certainly good news. So long as IBM continues to plug Warp to the consumer, there will be a demand for new OS/2 applications.

Admittedly other aspects of IBM's behaviour are not so encouraging for prospective Warp developers. For example, the Lotus acquisition may well damage the market perception of Warp. Lotus Notes is already the biggest selling OS/2 application, and now the biggest selling OS/2 application belongs to IBM. Sure, IBM will reap the immediate financial rewards, but now there is one fewer independent software company developing for Warp. It's all very well targeting an uncrowded market; but the thing can be overdone.

Of course, Warp's biggest test is yet to come. On August 24th (the latest date from Microsoft at time of writing) Windows 95 will be finally released. The first mainstream 32-bit operating system from Microsoft will obviously be a force to be reckoned with. And yet, and yet... Warp has the advantage of already having obtained stability, whereas we are still hearing of the compatibility problems caused by Windows 95. If too many existing applications fail under Windows 95, if it won't run on all those home PCs, if Microsoft fails to make the standard stick...

The race is not over yet.

Cliff Saran

Mayhem!

Ladies and gentlemen!
Introducing, for your
entertainment and delight,
Kinetic the Stupendous -
erm, ShuffleBot the barely
plausible - erm, well, judge
for yourself. **Jules** has been
inventing weird things again.

Back in October, you may remember, I was musing about making an artificial intelligent system which could control a motor-bike, and lamenting about the fact that it was so difficult. Some would say that it's because I don't have enough real work to do, but I haven't stopped thinking about that problem, and gradually, almost imperceptibly slowly, parts of the puzzle started falling into place.

Something else was interesting me at the time. Mobile robots are well-established in the public consciousness - science fiction has been telling us about them for years - but apart from a few totally impractical toys, they have never really taken off as a practical proposition. There's a reason for that - most mobile robots are pretty useless. After all, they take up loads of floor space, are as manoeuvrable as a car, they need special machinery to load and unload them, they are heavy, noisy, and need constant recharging. Probably the most practical use is motorised wheelchairs, which although may be a boon to their owners, aren't exactly the pinnacle of robot design. Most of all, though, robots are so mechanical. They don't purr, they don't tear up newspapers and sleep on your feet, they don't react to tapping on the tank, and they don't hold sensible conversations.

My robot bike was like that, too. It may have been an interesting intellectual exercise, but I really couldn't think of a single use for it. And then, inspiration struck. My problem, you see, was that I was trying to control the forces on two wheels, where each wheel was doing a similar, but different job. If I was having such problems

partitioning the tasks between the wheels, why not take one of the wheels away?

You know something - it works. It is not only possible to make a unicycling robot, it's easier than controlling two wheels. As the dynamics came into focus, and I understood how the thing would move, I laughed myself silly. In order to travel forwards, it would have to lean forwards, so from a standing start it would have to drive the wheel back a little, wait for the body to fall forwards, and then drive the wheel forwards. Stopping would have the same little jiggle - to slow down, it would drive the wheel faster for a moment. To turn left, it would step the wheel out to the right. It would move, in short, exactly like a cartoon character.

That's not all. The exact same sums would enable it to balance things on top of itself. It could be standing there, shuffling and whirring, and if you dumped a heavy box on top it would automatically shuffle in order to prevent the box from toppling. It could even balance glasses and bowls containing liquids. Now, moving forward would involve controlling the attitude of the payload as well as its own attitude.

I've explained my unicycle robot idea to quite a few people, and nine out of ten think I'm crackers.

That proves I'm onto a winner.

human, which takes up about the same floor space. It can carry loads, and it can adapt to dramatically changing conditions, like suddenly becoming airborne. But, most of all, it moves as if it's alive, and it's funny.

That's what's holding domestic robots back - they're just not very funny. If you could build a machine with a sense of humour, it would have a huge acceptance. You can sell anything if it's funny.

All robot designers have to think about safety. When this contraption starts to move, it has to announce the fact. A Road Runner 'beep beep' would be ideal, and would fit the motion of the machine perfectly. If the collision detectors forced it to pull up short, a quiet 'oops' would announce that fact. And of course, if someone was deliberately obstructing its progress, it could draw itself up on its variable suspension, lean forwards, and deliver a long, drawn-out raspberry.

What could you use such an idiotic device for? The first thought I had was of warehouse movers. In big warehouses, the mobiles need big wheelbases in order to get the necessary stability when loaded down with boxes. These devices would need much less space, and if one sinks while the other rises, two could pass each other in the same aisle. But the moving need not be constrained to the warehouse. In the offices, they could be used to carry boxes and papers around. You call a machine, place a box on top of it, and then punch in the extension number of the recipient. For offices, and as a personal porter, it would be much more effective than a four-wheeled vehicle.

As a personal porter, it would have immense value as well. At parties, where

one is standing up, and has run out of hands holding a glass, a plate of food, a mobile telephone, a pen and trying to find a business card, the robot could have a tray on top, holding all of these essentials. Normally it would sit behind and to one side of its owner, but when he reaches out his hand, it would step forward, offer up the tray, and then when he's picked up or put down whatever it is he wanted, it would settle back into its appropriately deferential position.

But probably the best use would be the one I identified in the opening lines - as a replacement wheelchair. People in wheelchairs spend their lives sitting down. That gives them, at these parties, an unequalled view of the other guests' waistbands, and a stiff neck with having to look up all the time. What's more, the wheelchairs take up more floor space than walking guests, and since the wheelchair users face is well below eye-level, they disappear from the crowd, being replaced by a big hole.

This device would solve all these problems. It would raise them to normal eye level, and reduce the floor space needed. People who still have upper body control can lean to control their attitude, and thus their direction and speed. People without could use some other control mechanism, and the robot would take responsibility for balancing them on top.

I'm not sure how serious I am about this idea, though I think I'm going to build one, just to prove it works. I've explained it to several people, and although a few see some merit in it, nine out of ten think I'm crackers. That proves I'm onto a winner.

Jules moved from four wheels down to two when he bought the motorbike. Now he's moving from two wheels to one. The next step is to remove the final wheel and levitate. Do you think he can do it? Call him on 01707 662698, or email him as jules@cix.

There's more. The suspension requirements are a bit peculiar, so I designed a variable suspension system for it. This would let it sink down at high speed on smooth surfaces, in order to get best traction, but would lift it up to get more suspension travel over rough surfaces and at lower speeds. Stationary, it would be able to adjust its height using the same mechanism, so it could tip its box off onto a table then go off for its next job. The same mechanism would enable it to jump, and a small adjustment to the control systems would allow it to jump over steps. It could even be made to perform pirouettes and somersaults.

Now, I'll freely admit that a unicycling robot is a totally barking idea, but let's look at what we've got. We have a machine which is only slightly less manoeuvrable than a

Manzi to stay

Jim Manzi, Lotus Development Corporation's chief executive, is to remain in charge of Lotus after the \$3.5 billion takeover by IBM announced recently. Manzi will become a senior vice president of IBM, although Lotus will still operate separately from IBM. The takeover of Lotus was agreed after IBM raised its hostile bid of \$60 per common share to an agreed price of \$64. IBM hopes to revive the flagging Lotus, but claims the acquisition has nothing to do with OS/2.

BT's crystal ball

A BT study foresees 3-D videophones, machines that recognise body language and gestures, and e-mail that talks to you over a mobile telephone, all within the next 25 years. A key element in making advances like these possible will be a huge increase in computer power, which could be a million times greater than today. Using a variety of strategies, including projection, extrapolation and 'guessology', BT has compiled some 200 predictions of technology and society. To find out more, call Nick Gordon-Brown on 0171 7296088.

Parallel solutions

Parallel processing has the potential to revolutionise operational systems, decision support systems and multimedia applications. This is the core message from the new report just published by Ovum, *Beyond the Data Warehouse: New Markets for Parallel Computing*. Ovum predicts that the market for commercial parallel systems will rise from \$1.5 billion in 1995 to \$2.5 billion by the year 2000. The growth is attributed to four main factors: accelerating user demands; decreased price of off-the-shelf components; support from leading industry suppliers such as IBM and Oracle; and parallel-platform availability of RDBMSs. The report is available for £995 - you can reach Ovum on 0171 2552670.

The rewards of innovation

With over 60 computing undergraduate entrants from all over the UK, the Softwright Innovation Award has attracted a wide variety of imaginative software projects. Entries have ranged from an OCR program for Hindi, to an expert learning system for nurses. The scheme was conceived by object technology software house Softwright. The results will be announced on September 20th - the first prize is a hefty £2000 worth of hardware plus a year's free subscription to CompuServe. For details contact The Softwright Innovation Award Office on 01628 524611.

EXE Show

The first EXE Software Developers' Show was a fun-packed two days held on 8th and 9th June at the Royal Horticultural Halls in Westminster. Major presences included Borland, Computer Associates, IBM and Symantec, but there were many other stands ranging from tool vendors to bookshops. The EXE stand itself proved to be a popular hang-out for developers and exhibitors alike - the attraction may well have been the demonstration of *EXplode*, EXE's World Wide Web site (<http://www.exe.co.uk>).

Attendees enjoyed software demonstrations, talks and 'guru hours' with industry figures like Bertrand Meyer, inventor of the Eiffel programming language, who considers the 'selfishness principle' to be a major concept of object orientation: objects are defined by their interface (what they have) instead of what they are. Seminar topics covered Windows 95 (with Matt Pietrek and Todd Johnson), the Internet, object technology and other less contentious issues. An interesting discussion was Keith Gladstone's on behalf of the RNIB, entitled 'Creating applications for the visually impaired.'

As far as software was concerned, there was a great deal to see. A popular theme of the show was multi-platform development, with Zinc's Application Framework 4.0, Professional Software's Utah, IBM's VisualAge C++ and Nat Systems' NS-DK/2 all making an appearance. Software metrics toolkits were also abundant, ranging from Program Analysers' LDRA Testbed to the impressive suite of code analysis tools offered by McCabe & Associates. Other offerings included postcode software, anti-piracy devices and code translation programs.

The date of the next EXE Show is still to be decided. If you want to find out more, speak to Tim MacPherson on 0171 2875678.

Smalltalk's not all talk

A study by International Data Corporation commissioned by STIC, the Smalltalk Industry Council, of nearly 300 corporate programmers shows Smalltalk on the move. It rated highest among object-oriented languages for corporate application development in terms of its *suitability* for such projects rather than its current prevalence in the industry. 'This survey proves that Smalltalk is gaining momentum as an idea whose time has come', claims Peter Day of Bloomsbury Software, UK distributor of Digitalk Inc's Visual Smalltalk.

The survey was conducted as a series of in-depth interviews rather than a questionnaire, leading to some interesting - and often personal - insights. For example, programmers thought it possible to become a 'recognised expert' in Smalltalk in just 18 months, compared with 23 months for C++. Significantly, 26 percent of object-oriented professionals *not* currently using Smalltalk would recommend it to MIS shops planning to adopt OO methods.

The study showed that four of the predominant problem areas associated with Smalltalk - speed, garbage collection, memory and ease-of-use - are becoming less and less of an issue, as operating systems become more resource-intensive and Smalltalk implementations better designed.

With portability, robustness and extensibility being prime considerations for big IT projects, the efficiency gain afforded by using a language like C++ (which has small run-time overhead) rather than one like Smalltalk or Lisp is becoming less significant. The current fad for RAD means developers are looking for environments suitable for prototyping and which provide rich run-time support. Maybe Smalltalk's time *has* come. International Data Corporation can be reached on 001 508 8728200.

BOOCH Vs RUMBAUGH

SYSTEM ARCHITECT™

System Architect's unrivalled multiple methodology support allows you to choose the method you want today, knowing that support for the method you want tomorrow is never far away. System Architect's common repository approach allows developers working on different projects using different methods to share design information. Indeed if you prefer you can mix methods on the same project. So whether you need Booch, Rumbaugh, Coad-Yourdon, Shlaer-Mellor or the future Booch/Rumbaugh method, System Architect delivers.

SYSTEM ARCHITECT PROVIDES

- Object-Oriented Support
- SSADM v3 and v4 Support
- PowerBuilder Interface
- Gupta SQL-Server Interface
- Schema Generation
- Reverse Data Engineering
- Documentation Facility

System Architect is the leading Price/Performance CASE tool. Feature-rich, easy-to-use, powerful and affordable.

Phone NOW to find out more.

Polishing off Visual Basic

Aardvark Software has released the Polisher, a source-code processor for Visual Basic which performs, among other things, syntax-aware spelling checking, configurable code formatting and automatic generation of comment blocks. You'll be able to get a copy from Grey Matter, on 01364 654100. At the time of writing no UK price was set but it's shipping for \$129 in the US.

Real-time OS for PowerPC

Swedish company Enea Data, provider of time-critical systems and development tools, is implementing its OSE Delta real-time operating system for the Motorola PowerPC 603 chip. OSE Delta is a distributed operating system designed for use in non-stop and fault-tolerant systems, such as telecommunications applications, and is the latest addition to the OSE family. Currently it's only available for Motorola 68xxx and AMD 29K microprocessors - a full port to the PowerPC architecture is scheduled for early 1996, although beta releases will be available earlier. You can speak to Enea Data by dialling 0046 86385000.

Codewright for VC++

Premia Corporation's new version of its Codewright programmer's editor has all the features of its standard Professional edition, with the added ability to plug seamlessly into the Microsoft Visual C++ IDE. Codewright Fusion comes with command sets compatible with other popular editors such as Brief, file comparison, language templates, a syntax-sensitive spell checker, brace/parenthesis matching and much more. If you're grabbed by grep or desperate for programmable macros, this could be for you. Programmer's Paradise 0161 728 4017 is selling it for £98.

Eiffel

Interactive Software Engineering's Eiffel development environment is available for Windows. Currently, only an entry-level version is available, for just £79 - this is interpreted, and doesn't come with a compiler, although all libraries provided are pre-compiled. A full-blown Windows version is on its way, for £650. The package is also available for Linux (£179); full Unix versions start at £1700. The low-end versions don't come with a language reference, so it may well be worth investing in Bertrand Meyer's book *Eiffel: The Language* if you're interested. Speak to Everything Eiffel on 01772 687525 for details.

The heat behind HotJava

You may have already heard about HotJava, Sun Microsystems's new World Wide Web browser - especially if you've been perusing *EXplodE*, *EXE*'s on-line Web site. HotJava builds on the Internet browsing techniques established by Mosaic by implementing the ability to add arbitrary behaviour. Using HotJava, you can embed entire multimedia applications into standard text files which the user can download and execute locally.

Lurking behind the scenes, however, is Java itself, an object-oriented programming environment for the Internet. The Java language gives HotJava users the power to develop small, interpreted applications - 'applets' - to distribute over the Net. Modelled primarily on C++, but omitting many of the rarely used and poorly understood features of C++ such as operator overloading and multiple inheritance, Java emphasises type safety, compile-time error detection and portability. Although interpreted, the run-time requirements are small. The interpreter and class support need about 40K; an additional 175K adds the standard libraries and thread support. For enhanced performance, interpreted code can be compiled on the fly at load-time into native machine code.

A number of companies, including Toshiba and Starwave, have announced plans to integrate the Java technology and HotJava dynamic browser into new applications they will develop for the Internet. Both Java and HotJava are free for non-commercial use by end-users. They're available in alpha release for developers and end-users on SunOS, Solaris and Windows NT, with Windows 95 and MacOS 7.5 ports due in late summer. The HotJava beta release, available late summer, will include a bundled WYSIWIG page builder and integration with third-party authoring tools. Locate Sun at <http://www.sun.com>; the Java-specific pages are at <http://java.sun.com>.

API extensions for OS/2 Warp

The current obsession with cross-platform development seems to have caught IBM's interest as it approaches the problem of portability from two opposing directions. It recently announced its IBM Developer API Extensions to OS/2 Warp, a carefully chosen subset of over 700 API functions and 300 messages which are consistent with the Win32 API. A simple recompilation will soon be sufficient to port many Win32 applications to Warp. IBM has obviously been forced to take Microsoft's marketing plans seriously, with Windows 95 set to topple OS/2 from its position as the most popular PC-based 32-bit operating system.

This concession to Microsoft's Win32 API flies somewhat in the face of the recent object-oriented approach, which relies on abstraction to achieve portability. Platform-independent class libraries such as MFC, Borland's ObjectWindows Library and IBM's own Open Class Library, currently in beta, allow developers to ignore the details of system-specific API calls and concentrate on the logic of their application. John Swainson, IBM vice president of application development solutions, sees the Developer API Extensions as OS/2's solution for migrating existing Windows applications, but thinks software companies in the future will invest increasingly in 'object technology in the form of portable and interoperable class libraries and frameworks.' Currently Open Class Library is portable across AIX, OS/400, MVS and Sun Solaris.

To aid vendors wishing to migrate existing Win16 or Win32 applications to OS/2 that were written without the use of a portable class library, IBM is licensing OneUp Corporation's Source Migration Analysis Reporting Toolset (SMART). It's a code-processing software that will automatically convert the majority of C/C++ Windows code to 32-bit OS/2 Warp, as well as highlighting which parts of the application use the API extensions, and making recommendations for sections it can neither port nor recognise as a call to one of the new APIs.

You can find IBM's Home Page at <http://www.ibm.com>, or telephone their Solution Developers' Helpline on 0345 522622.

Build better applications.

Add performance, functionality & versatility

SQL Server

Microsoft SQL Server 6.0 is a scalable high performance database management system designed specifically for distributed client-server computing. Its powerful management tools, built-in data replication, and open system architecture provide a superior platform for delivering cost-effective information solutions for organisations of all sizes.

PowerBuilder Desktop for Windows 4.0

A powerful Windows desktop application development environment with an integrated client/server architecture which includes powerful object-oriented programming tools. With PowerBuilder Desktop you can easily create robust Windows applications that incorporate data from most desktop databases. The Watcom SQL database is included for development and deployment out of the box.

The PowerBuilder family

includes the new PowerBuilder Component pack. Competitive upgrade for most desktop database users £189

Visual FoxPro version 3.0

Easy enough to be Visual, powerful enough to be Foxpro. Microsoft Visual FoxPro combines a visual development environment with new tools for creating solutions that include the Microsoft Office and BackOffice families. Its flexible targeting puts existing Xbase code to work in Windows, Windows NT and Windows 95. Visual FoxPro increases developers productivity with the addition of Rapid Application Development features such as dragging and dropping visual classes onto forms. Call for pricing and upgrade information.

Codewright Fusion

Codewright Fusion is a drop-in replacement for the Visual C++ editor. It adds the power of a stand-alone programmer's editor to the convenience of the workbench. Codewright Fusion, available for both 16 and 32 bit versions of Visual C++, provides a host of features never before available under Visual C++.

develop to advantage

WatcomSQL Server

Presenting Watcom SQL, the industrial strength database server that makes deployment of PC Client/server applications both simple and inexpensive. Advanced features include triggers, stored procedures, and a self-tuning query optimiser that "learns" as you use it, making it smarter...and faster. With hundreds of thousands of copies already

installed on Windows, NetWare, OS/2 and NT, Watcom SQL is the right choice for PC applications.

VTOLSD from Vireo Software

A C library and C++ Class library of functions for developing Windows or Windows 95 Device Drivers. The Quick VxD code generator automatically writes the VxD skeleton, custom header files and libraries automate segment management and expose VMM functions to C & C++ programmers. Debug and final release libraries are included. Combine with Nu-Mega's Soft-ICE/W, to get the complete VxD build and test solution.

Anywhere

MKS Internet Anywhere is an easy-to-use software package that demystifies PC access to the Internet, and enables users to quickly set-up Internet access. It comes with a complete set of utilities including electronic mail, Usenet News, a WWW Browser, file transfers, and terminal emulation. With MKS Internet Anywhere all you need is a PC running Windows 3.1, a modem and a PPP or SLIP Internet account.

MKS
Internet

Soft-ICE Windows

Debugs Windows executables and DLLs with the capability of setting, breakpoints on I/O ports, interrupts and Windows messages as well as source lines and memory addresses. Exploring Windows internals and the ability to debug Virtual Device Drivers (VxDs) makes Soft-ICE the ultimate Windows debugger. The new Windows 95 version is ideal for Windows 95 VxD developers. £295 each

Your first choice for better development tools

CIRCLE NO. 193

Soft-ICE for Windows 95

Nu-Mega Technologies' new Windows 95 system-level debugger loads itself and then loads Windows 95 on top of itself, allowing you to debug at source level, VxDs and other device drivers loaded during the boot process. Furthermore, Soft-ICE debugs both sides of a Universal Thunk (32-bit and 16-bit code) and will catch system exceptions such as page faults or invalid opcodes. A plethora of information concerning paging, memory management, threads, mutexes and semaphores is provided. Nu-Mega recommends Soft-ICE for use with the Bounds Checker debugging tool; see the article *In Leaps and Bounds* in this issue. It costs £295 from System Science (0171 833 1022).

Borland Turbo C++ 4.5

Borland continues to support its Turbo range of compilers with a new release of Turbo C++. Version 4.5 for Windows comes with an IDE, a multi-target project manager, a BRIEF-based editor, an object browser, ObjectWindows 2.5 and Object Components Framework, a C++ encapsulation of OLE 2.0. The compiler itself supports templates, exceptions and RTTI. The whole kaboodle is a snip at £69 - for more information check out <http://www.borland.com> or call 01734 321150.

C-Vision supports C++

C-Vision is a set of tools to help programmers analyse, understand, document and maintain C source code. Version 4.0, just announced by Gimpel Software, extends C-Vision's functionality to cover C++. The package includes a cross-referencer, which produces lists of symbols with usage and type information; a diagrammer, for function-call graphs and class hierarchies; a source code reformatter; and an intelligent lister capable of identifying block entry and exit points. It's available from Grey Matter (01364 654100) for £145.

World Wide Warp

OS/2 Warp Connect, the latest version of IBM's popular operating system, will ship with a TCP/IP application that lets users simultaneously connect to local/wide area networks and to the Internet. The TCP/IP application includes the IBM Web Explorer, an Internet hypertext browser. Warp Connect itself comes with a variety of other comms products and features, including LAN Distance, which supports remote on-line access to LANs via a telephone line, allowing a laptop to become a remote LAN client. For more information on OS/2 Warp Connect, browse <http://www.ibm.com>, or ring 01329 242728.

Delphi tools on the way

Borland has responded to the almost immediate demand for Delphi tools by releasing the RAD Pack for Delphi, a 'companion' tool set which includes Resource Workshop, Resource Expert, Visual Solutions Pack, a printed version of the Delphi Language Reference Guide, Turbo Debugger and the source code for the Visual Component Library. This last item will be of particular interest to many developers, giving them some insight into the library's internals and allowing the creation of custom components based on standard Delphi ones.

MicroHelp, Crystal and FarPoint Technologies, partners of UK development tool publisher Contemporary Software, have confirmed that many of their tools, widgets and report generating programs will work smoothly with Delphi, including Compression Plus 4, Fax Plus and Crystal Reports. 'Borland has been working very closely with Contemporary Software, and other tools vendors to ensure that there are the widest range of third party tools available for Delphi,' explained Guy Martin, Languages Product Marketing Manager at Borland UK. Other products are currently undergoing testing. According to Contemporary Software, Sheridan also plan to support Delphi with their suite of development tools (VBAssist, DataWidgets and others) 'as soon as Borland upgrades Delphi to work with Level 3 VBXs' - do they know something we don't?

The RAD Pack is retailing for around £149. For more information contact Borland Customer Services on 01734 321150, or peruse Borland Online at <http://www.borland.com>. Contemporary Software can be reached on 01727 811999.

DLLs in VB

Development tool company DataObjects has released version 1.5 of its VB/DLL Library Builder, a custom control add-on that enables a Visual Basic application to conceal its VB interior behind a C DLL interface, whilst retaining its full executable status. Like Windows DLLs, loading and unloading of the Visual Basic program is transparent. A single 32 K control instance can export as many functions as required. To a client program, the VB executable appears to be a normal DLL, meaning that Visual Basic functions can be called from any application that's written in a programming language which can call a Windows DLL. (See *Creating Windows DLLs using only Basic Source Code* further in this issue for the review of two other products.)

DataObjects intends VB/DLL to be used as an alternative to DDE or OLE automation for client/server or cross-application programming, or for building reusable libraries in VB, reducing code redundancy in large projects. An imminent version 2 uses the Winsock API to support RPCs across TCP/IP networks, allowing VB server applications to be moved to network servers without modification. Available from Grey Matter on 01364 654100 for £165.

Prolog for Windows

Most people remember Prolog either as something they used once or twice at college, or as an AI programming language they've heard of but never tried. One of the reasons Prolog and similar languages have always been fairly insular is that they traditionally require a single integrated environment for development, with little option for producing standalone applications or interacting easily with other software.

Two tools bringing Prolog into the everyday world of PCs and GUIs are Logic Programming Associates' WinProlog, and PDC's Visual Prolog 4.0 Professional Edition (recently licensed to the Open University for students studying Artificial Intelligence). WinProlog is a 32-bit implementation (even under Windows 3.1), with incremental compilation/linking and the capability of generating stand-alone programs which can be run outside of its IDE. Dynamic linking via DLLs and direct communication with any DDE-aware Windows application are supported.

Visual Prolog, currently in beta, offers even more to the developer - it's multi-platform, capable of targeting DOS, OS/2, NT and numerous UNIXs, and comes with resource editors and a suite of code 'experts'. A C or C++ program can call both your compiled Prolog code and PDC's standard library directly, if you feel like adding a declarative dimension to your C/C++ applications. OLE is also supported, and under OS/2, asynchronous IPC via named pipes.

LPA WinProlog 3.0 goes for £745, or £1,495 for the Developer Edition to produce stand-alone applications. PDC Visual Prolog 4.0 costs £670 for the Professional Version. You can speak to LPA on 0181 8712016, or e-mail them at lpa@cix.compulink.co.uk. Call PDC UK Distribution on 01603 219210.

Tired of Juggling Your Team Development?

Want more info?
2 free White Papers?
PVCS demo diskette?

.....call.....
01727 812812
EXT. 255

Team development adds its own set of challenges to the development process—communicating the right information at the right time to the right team members. How do we keep all the configuration management balls in the air at the same time? Can we control access to protect the code? Did all the changes make it into the release? Will applications build properly?

PVCS—The Standard for SCM

INTERSOLV PVCS adapts to your environment with automated software configuration management (SCM) for team development. The standard for SCM on the LAN, PVCS lets you and your team work smarter, increase productivity, and accelerate delivery.

PVCS is used by more developers than all other LAN-based SCM tools combined.

And, PVCS covers more operating systems, development environments, and object types than any other SCM tool.

So stop juggling and focus on what you do best—development.

We'll show you how. Call us today at **01727 812812**,
Ext. 255.

Letters

We welcome short letters on any subject that is relevant to software development.

Please write to: The Editor, EXE Magazine, St. Giles House, 50 Poland Street, London W1V 4AX or email editorial@dotexe.demon.co.uk Unless your letter is marked 'not for publication', it will be considered for inclusion. Letters may be edited.

Patenteese

Dear Sir,

Regarding the article on the Unisys patent and GIF in the May issue of *EXE*, a great deal of inaccuracy does appear on page 24 in the section titled 'Patenteese'. In particular, that section states that the U.S. Patent Office failed to recognise that the IBM Miller/Wegman covers the same algorithm as the Unisys Welch patent. In fact, the Miller/Wegman patent is for a different invention that covered by Welch.

The U.S. Patent Office recognised this fact when it re-examined the Unisys Welch patent. Thus, the Miller/Wegman patent was reconsidered and made of record during the re-examination. As a result of the re-examination, on January 4, 1994, the U.S. Patent and Trademark Office confirmed the patentability of the original 181 claims in the 1985 Welch patent and the 55 claims added during re-examination.

It should also be pointed out that the European Patent Office considered the Miller/Wegman patent application during its examination of the Unisys European patent application and found the Unisys patent application to be patentable over the Miller/Wegman reference.

Mark T. Starr

General Patent & Technology Counsel
Unisys

The two patents might not - legally - cover exactly the same invention but it is commonly accepted that any LZW algorithm infringes both. Straight from the Frequently Asked Questions (FAQ) for the groups comp.compression and comp.compression.research: 'The IBM patent application was first filed three weeks before that of Unisys, but the US patent office failed to recognise that they covered the same algorithm. (The IBM patent is more general, but its claim 7 is exactly LZW.)'

From a software developer's point of view the main difference between the two patents is that Unisys started to enforce

royalty payment on its patent while IBM hasn't so far done the same. We will soon have some articles on alternatives to the LZW algorithm for both graphic compression and more general use.

Fire buttons

Dear Sir,

An interesting article on page 21 in the January issue of *EXE* called 'More than a game...' showed how to access the games port of a PC. Using Visual C++ and the `_inout` instruction, I have successfully managed to read the four analogue inputs of the port. Unfortunately, however, I have been unsuccessful in reading the four digital inputs (i.e. joystick fire buttons) of the port. The article mentions that this is possible, but I cannot find a way of doing it. Please could you enlighten me on this subject.

Darren Sharpe
Nottingham NG6

The author, Michael Covington, replies: 'The button inputs (4 of them) are pins 2, 7, 10, and 14. These are TTL inputs with 1k pullup resistors; the other side of each button goes to ground, or you can even attach TTL-chip outputs to them. The data appear as the upper four bits of port hex 201. I can't remember if they're inverted.'

Bug or feature?

Dear Sir,

I know that *EXE* magazine is primarily intended for 'proper' programmers, but I would like to discuss Microsoft FoxPro for Windows.

I have been developing applications using FPW ever since its release, and I have found myself in an ever increasingly difficult battle against the bugs it appears to contain. The best support I have been able to obtain from Microsoft is via the Fox Forum on CompuServe, and in a recent message posted to the SYSOP I asked if there was a way of getting active support for FoxPro, i.e. if we report a problem to Microsoft then Microsoft should fix it, just as when one of our cus-

tomers reports something is wrong with our software, we fix it.

The essence of the reply I received was: 'Microsoft does not supply the level of service you require....'

Am I right in thinking that if somebody supplies me faulty goods that they are liable in some way, or am I completely mad?

I believe that Microsoft has created an environment where use of its development products is often 'expected' by the application-buying public, so surely it must accept that it should support the developers who use them. When am I going to feel that Microsoft has taken its responsibilities seriously?

SJ Watts
Apache Solutions Ltd
Herts

There is no such thing as 'proper' and 'improper' developers. We do cover Fox Pro regularly (see EXE May '95 pp. 59-62). Regarding the main issue of your letter, i.e. support, this is a very complex issue. Most software companies do not sell software but only a right to use it. The only explicit warranty concerns media defects. Software houses are legally liable only for their software to perform as advertised, nothing more. In fact many companies, including Microsoft, sell different levels of support in addition to the basic price of the software. These specify the maximum period of time before they will return to you after you have requested service. But very few ever promise to correct bugs even though it is in their best interest.

The solution when you buy development tools is either to be ready to work around all the bugs that you will find, secure an agreement with the tool vendor to guarantee timely support or go for a tool which is given with its source (such as the FSF's GNU tools). A long-term option is to create a user group to be able to put pressure on the tool's company. Of course, this whole situation is totally inadequate for software developers who have their own bugs to contend with.

DATABASE PROGRAMMERS' RETREAT

PROGRAMMERS TEACHING PROGRAMMERS

NEW COURSES

Advanced Visual Objects

A very practical, second level class for all existing VO programmers. You'll build several complete real-world programs which manage multiple tables with several parent-child relationships. Learn the ins and outs of data and sub data windows, browsers, event notification, modal and non-modal interfaces, advanced menu handling, how to access the Windows API, creating your own windows and controls, and much more.

5 Days **Cost £1,125**

Visual Basic & Client Server Programming

This course concentrates on client server database programming developing an application under Windows for Workgroups networked with a server running SQL Server. The development work will include design, prototyping and implementation of a complete multi-table application.

5 Days **Cost £1,125**

Consultancy/Programming

Need help? Give us a call. We'll be pleased to assist and advise your development projects on a daily, weekly, or monthly basis.

**CALL (+44) 1452 814303
FOR DETAILED COURSE
OUTLINES & SCHEDULES**

Delphi Programming Part I

A very practical, hands-on class giving a thorough introduction to writing database applications in Delphi. Assumes little or no prior experience with Pascal. Learn how to create multi-table database applications, object oriented programming with Pascal, OLE, DDE, Interbase Server, and more.

5 Days **Cost £1,125**

NetWare Programming

Migrating to C

A practical look at converting from high level languages such as Clipper and FoxPro to C. Learn the differences between them and identify the best way to convert your current programming skills. This course will help make the learning curve less steep.

2 Days **Cost £495**

Introduction to the NetWare Client API

A practical introduction for C and Assembly level programmers to the NetWare Client API. Learn about the different client services and how they can be accessed using either the NetWare C interface or the NetWare requester. This course gives a good insight into how NetWare works.

1 Day **Cost £250**

Programming the NetWare Client API

A thorough introduction to writing NetWare aware applications using the NetWare C interface or the NetWare requester. Learn how to create applications and utilities in both DOS and Windows that interface directly with the NetWare operating system.

2 Days **Cost £495**

Advanced NetWare Client Programming

An intensive course covering advanced programming of all aspects of NetWare Client API. Learn to control the Bindery, QMS and NDS services, and how to create peer-to-peer applications and utilities in both DOS and Windows using IPX and SPX.

2 Days **Cost £495**

Wireless & Wired

Wireless mobile phones and laptop computers can now be wired together. **David Mery** shows how to take advantage of the combination of the two.

At the office you have access to email, to voice communication, to data transmission... As soon as you walk away from your desk you lose most of these facilities. The main reason is that you need to have lots of equipment tethered to different wall plugs: a computer to at least one network connector, a modem, and a phone to one or more phone plugs, etc. With today's technology - mobile phones and portable computers - there's no reason why you shouldn't have access to all these capabilities and more, whether 50 feet or 500 miles away from your desk.

What can be done when a mobile phone is controlled by a laptop? Data transfer is an obvious application, but for anyone who stores and manages his dialling directory in a mobile phone, access to the phone's directory is equally important. Digital cellular phones such as GSM (Vodafone and Cellnet) and PCN (Hutchison's Orange and Mercury's One2One) also offer the capability of transferring short messages between two phones when available on the network. This service, SMS (Short Messages Service) is a good candidate as a function which can be managed from a computer. Entering a message from a phone key-

pad, even if only 160 characters, can be tiresome.

In this article I'll look in more details at two offerings provided by Nokia Mobile Phones. One comprises of a PCMCIA data card and cable to link the data card to a Nokia GSM or PCN phone. The data card provides data and SMS capabilities. The other one is made up of a serial cable linking the phone directly to the serial port of a computer and a TAPI driver.

I tested the two setups with a GSM Nokia 2110 on Vodafone and an Orange PCN Nokia 2140 phones. The serial link only worked with the GSM phone. It requires version 4.76 or better, of the firmware and the PCN phone I had was only 4.67 (the GSM had a revision 4.90). You can check which version of firmware your phone has by typing '*#9999#' on the phone's keypad.

Wireless data

Data transfer is completely transparent. Insert the PCMCIA data card into a laptop, connect the cable to the card and the phone and you're ready to use any standard communications application. The phone then acts as a 9,600 bps modem. The link from your computer up to the network communication centre is completely digital, so in fact the phone/data card is behaving more like an ISDN terminal adapter (TA) than a Modulator-DEModulator (see Figure 1). All of the basic AT command set, standard with both modems and TAs, is recognised.

The data card currently supports one proprietary command `AT+c` to control the SMS. In the future Nokia will support the official 'AT Command Set for GSM Mobile Equip-

ment', but probably not before the standard is finalised, nearer the end of this year. The current proposal for these AT extensions, dated March 15, has been written by Nokia, Ericsson and Hewlett-Packard. It defines the `AT+c` extensions (see Table 2).

Taking control with TAPI

The second setup, with the serial link, doesn't allow data transmission but gives access to quite a few features of the phone. This option is currently in final beta test. It's completely operational; Nokia just hasn't yet decided on the complete list of functions which will make the distribution release. The software interface is based on Microsoft's TAPI (Telephony API). This is one of the two specific APIs proposed as standardised means of information exchange between phone networks and computers. One is Windows specific: TAPI, while the other is NetWare specific: TSAPI (Telephony Services API). Most new applications conform to one of these but some work is also done outside these standards.

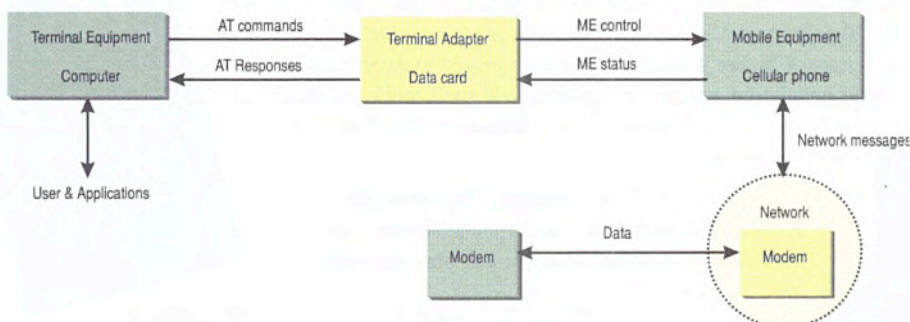

Figure 1 - Mobile data setup

VISUAL BASIC® TOOLS

THE DEVELOPERS' SOFTWARE

Save time and money with the best range of powerful and easy-to-use Visual Basic® development tools from Contemporary Software. Featuring leading products from MicroHelp, Sheridan, FarPoint and Crystal Services.

MICROHELP

VBTOOLS 4

54 different custom controls (VBX's) compatible with all Windows development environments that support the VBX extensions.

COMPRESSION PLUS

A comprehensive set of ZIP - compatible data compression routines for DOS and Windows. Compress files, arrays and screen images to a fraction of their original size, decompressing them only when needed.

FAX PLUS

Send and receive faxes using almost any class 1, 2 or 2.0 fax modem in ASCII text, BMP, PCX and DCX file formats.

MUSCLE

Over 600 functions to enhance the speed and capability of your applications.

SPELL PRO & THESAURUS

A spellchecker and dictionary of synonyms DLL that can be used by almost all Windows development environments.

VBVIEWER

A file viewer custom control that can display over 20 different file formats.

COMMS LIB 3

Reliable, easy to use communications routines with a wide variety of terminal emulations and file transfer protocols.

NETWORK LIB

A DLL that provides access to several Novell, Lantastic and NetBios related services.

VBXREF

The best project management and cross reference tool. Work with up to 10 projects at one time, and view 20 different forms or modules and 20 file viewers.

SHERIDAN

VBASSIST 3

Powerful design tools and new data access extensions for Rapid Application Development.

DATA WIDGETS

Design database application front ends without time consuming coding. Take full advantage of VB's data access features.

DESIGNER WIDGETS

Create apps that look, feel and act like top selling commercial packages.

3-D WIDGETS

12 custom controls to give a professional 3-D look to your application.

CRYSTAL

CRYSTAL REPORTS 4

The standard edition lets you create reports using data from the major PC databases easily and simply.

CRYSTAL REPORTS PRO 4

Pro 4 gives even more reporting functionality, a full copy of TrueGrid 2 + access to SQL databases.

FARPOINT

AWARE/VBX

Build flexible front ends with full data entry controls for the Access database engine.

TAB/PRO

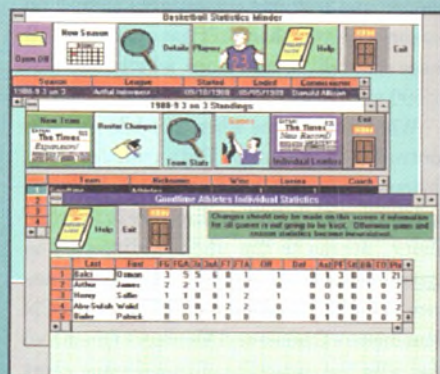

A design time interface for creating customised tabs which give applications a truly professional and organised quality.

SPREAD/VBX

Over 250 properties make this the most powerful combined spreadsheet and grid control for the Access engine.

GRID/VBX

The best grid for the Access engine with 2 billion rows and columns capacity.

HOT OFF THE PRESS

ALL THE VB TOOLS YOU'LL EVER NEED!

■ 20 of the best Visual Basic programs are featured in our new colour brochure. Whether your applications are geared to database design or report generation; whether you want to add spell check, communication routines or mailing labels, project management or 3-D effects - there's something for you.

■ Top products from Crystal Services, Sheridan, MicroHelp, FarPoint and INTERSOLV are explained clearly and concisely. Prices start from just £75 plus discounts for 2 or more products.

CONTEMPORARY
Software

TAPI includes a set of general functions which are available with most telephony devices, such as dialling and answering a call, as well as a standardised way of adding extensions. With the basic TAPI

functions a call can be initiated on the mobile phone, using TAPI SDK's dialler sample application. To control all the more specific features of Nokia's phones, Nokia's TAPI driver adds TAPI functions at the Service Provider Interface (SPI) level (see Figure 2). These functions give access to the short-code memory (phonebooks), to keyboard, display, tones and audio settings, to the short messaging service (SMS) and to other miscellaneous functions (Roaming mode, InService/OutOfService information, MsgWaitOn/MsgWaitOff status).

To use Nokia's driver, the TAPI SDK must be installed first. It can be retrieved from the WINEXT forum on CompuServe or from Microsoft's own Web site (at the URL <http://www.microsoft.com>). If Windows crashes when you install the Telephony applet in the Control Panel, check that you do not have too many applets installed already. There's an undocumented limit to the number of applets that can be initialised at one time. When there are too many, Windows runs out of stack space and crashes with no clear diagnostic. This is what happened to me! Another solution is to launch CONTROL.EXE from the File/Run menu option in the Program Manager with the name of the applet, TELEPHON.CPL, as a parameter.

Once all this has been sorted out you can at last focus on developing your application. Listing 1 shows excerpts from a sample program written by Nokia to read and write the phone memory. The code shown here includes only the general TAPI code and the code to read the phone memory. Let's walk through it.

Asynchronous events

The function `INITTAPI` starts by defining a TAPI callback procedure, to be invoked

AT command set extensions

Modem control has gone a long way since Hayes introduced the **AT** command set in 1981 with the Smartmodem 300. Most of the basic standard commands have now been codified in the recent V.25ter recommendation of the ITU-TSS (see Table 1). At the same time, several standardisation groups have worked on defining extensions to the basic command set. These extensions cover a wide range of activity where communication is involved and go much further than just controlling a modem. Extensions includes the well known **AT+F** commands for fax control. But that's not all, voice and wireless communication management are just two other examples of the work that has been done.

Table 2 should help you to find which new extensions might be relevant for any planned development. The table also gives references to the different standards. This is key information when trying to find more documentation. For instance on the ITU Web site (<http://www.itu.ch/>), all the documents are accessed either by a number or by moving through a hierarchy modelled on the group organisation of the ITU.

Beware of still-born standards. Before deciding to comply with a one, check that products are available or your - communications - application may be *lonely*. For instance, to this date there's no commercially available product which conforms to the **AT+C** extensions, even though several mobile phone manufacturers have data adapter in their catalogue and the need is there.

when a TAPI event occurs. This mechanism is provided for asynchronous calls which do not perform any actions immediately. Any call which requires an action taken by the telephony device can take ages to return. The `lineInitialize` function passes the pointer to the callback to TAPI and returns immediately with the number of line devices available to the application. Then, since we want to use TAPI extensions defined by Nokia, we have to negotiate the extension version needed. This is the role of the `lineNegotiateAPIVersion` and `lineNegotiateExtVersion` functions. The first call will return a pointer to a `LPLINEEXTENSIONID` structure containing the ids of provider-specific extensions. The second call negotiates the version of these extensions that will be called by the application.

The last step of the initialisation process is to call `lineOpen` to open the line device. The line handle returned by `lineOpen` is used in all subsequent TAPI calls. Two of the parameters are worth mentioning. The first one, `LINECALLPRIVILEGE_OWNER`, concerns only incoming calls. `OWNER` means that the application wants to own all incoming calls of the type set by the next parameter. To set the type of calls of interest to the application, we need to set the right flags in the `dwMediaModes` parameter. This is done with `LINEDEVMODE_INTERACTIVEVOICE`. If we hadn't known what service the connected device was offering, especially what type of media mode was

supported, we should have issued a `lineGetDevCaps` beforehand. This returns all the telephony capabilities of the line device in a `LINEDEVCAPS` structure.

The `ReadMem` function works by asking TAPI to perform the extended function `scm_FUNC_READMEM`. When the memory reading has been done, TAPI will invoke the callback function. This is an example of how to call a Nokia specific function and how the asynchronous calling mechanism works. The first step is to initialise the structure pointed by `lpReadMemParams`. This pointer will be passed to TAPI. The structure is initialised with the read memory specific function id code, the type of memory that we want to read (the phone's own memory, or the one of the SIM card present in the phone) and the memory range. The `lineDevSpecific` API is an Extended Telephony services function provided specifically as an extension mechanism. It just tells TAPI to pass the information to the Nokia driver. Use of `lineDevSpecific` makes an application non-portable, i.e. it can't use other TAPI devices but that's its *raison d'être*: to access functions that are present in just one specific device.

Next is an abridged version of the callback function. It first checks if it has been called to report the results of a previous function call which completed asynchronously. This is the reason of the case `LINE_REPLY`. In the case statement the `if (dwParam1 ...)` checks which functions originally called TAPI, in

Acronym	Meaning

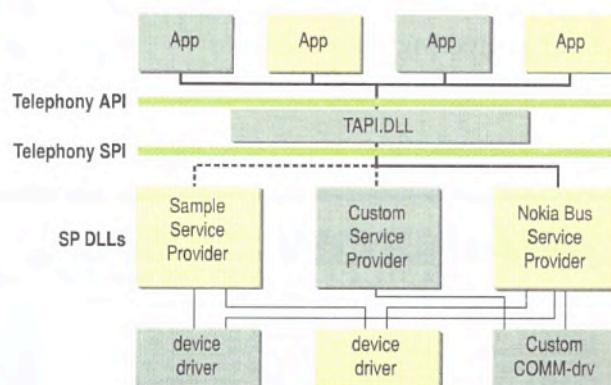

Figure 2 - TAPI setup

Reliability you can depend on

In 1994, Sentinel improved its industry leading reliability to over 99.985% – far more reliable than any other software protection product.

The industry's highest quality

Rainbow is the world's only software protection supplier with ISO 9002 certified quality standards.

Manage network licenses

NetSentinel™ is the only protection to undergo rigorous testing by and receive approval from Novell.

Truly transparent protection

Designed to go unnoticed by your customers, Sentinel does not interfere with hardware, peripherals or other software programs.

A substantial investment in R&D

In 1994 alone, Rainbow invested over \$4,500,000 in R&D to make the world's leading software protection even better.

Compatible with your software

Our partnerships with Apple, Microsoft and IBM mean Sentinel protects software for any hardware or operating system.

Global service & support

Rainbow supports its customers with offices and distributors in more than 40 countries.

Product is shown larger than actual size. In fact, the SentinelSuperPro™ is the world's smallest dongle.

Total security & flexibility

Sentinel keys are available with proprietary ASIC technology, multiple EEPROM cells or even a microcontroller – giving you the world's best software protection.

Why this dongle protects more software than all others combined!

Over 6,500,000 Sentinel® keys protect software worldwide. In fact, 55% of all protected software has a Sentinel key, from Rainbow Technologies.

Today, software piracy is at an all-time high. If you're selling software without protection, you're losing sales and revenue.

Start protecting your software investment. Stop software piracy

with Sentinel, then watch your sales and profits increase.

Discover the Sentinel difference. Sentinel is easy to implement, transparent to end-users, and backed by the world leader. When you need on-time delivery with local support, you need Sentinel.

Only Sentinel delivers leading-edge technology, ISO certified quality and over 99.985 % reliability.

Protect your software today. Order a complimentary 28-day *Sentinel Developer's Kit*. It comes complete with technical documentation, software drivers, utilities, and a Sentinel key.

Call today and ask about our 20% *New Customer Discount*.

this example there's only one possibility: the `ReadMem` function. Its main action consists of sending a message to the main window of the application which will in its turn process the results by displaying the contents of the phone's memory in a *nicely* drawn dialog box.

An important but straightforward function is `LineErrorMsg` to report in a clear way to the application's user any error generated by TAPI. There's a large selection!

`DeinitTAPI` is called just before exiting the program. It issues a `lineClose` to close the line device opened with `lineOpen`, and `lineShutdown` so that TAPI knows that it will no longer be used by this application and can free any memory it had reserved.

Generic or specific?

Developing an application to use in conjunction with a mobile phone is pretty straightforward, either using the AT command set with the data card or TAPI with the serial link. As can be seen above there's no real

mystery with either programming model. So the question is what type of application to develop? One approach is to adapt existing 'communicating' programs to work with mobile phones. This should require few, if any, modifications and they will be trivial. The other approach is to use the more specific attributes of the digital mobile phones. This implies that the application will be specific to a single phone manufacturer but it is a more interesting approach. It allows developers to create, for instance, an application which reads the phone number of an

Listing 1 - Main TAPI functions needed to read the directory memory of a Nokia digital cellphone

+A, +D, +E, +G, +I, +M, +S

Scope	General modem use (DTE-DCE Interfaces)
References	ITU-T V.25ter subsumes the contents of TIA-602 (basic Hayes set), TIA 615 (extension rules) and TIA IS-131 (particulars including +M, +I, +G, +E and +D). +A is described in the project PN-2989 from TR-30.4.

+F

Scope	Group 3 facsimile digital interfaces (Class 1 and Class 2)
References	ITU-T T.31 (superset of TIA-578-A) and T.32 (superset of TIA-592, TIA-605 and TIA IS-134). This was originally described in TR-29.2.

+V

Scope	Voice control
References	Current published version is TIA-IS-101-1993 but the current committee version is TIA-PN-3131R3. This project was moved from TR-29.2 to TR-30.4 for merger with work on conferencing modems (+S). It will become a contribution to ITU SG14.

+C

Scope	TDMA, Spread Spectrum and Global System Mobile digital cellular
References	TIA TR-45.3 handles US-TDMA and TIA TR-45.5 handles US-CDMA. Work is in progress with SMG4 of ETSI regarding GSM digital cellular data (the data service document is called IS-99).

+W

Scope	Wireless communications services (commands to chose wireless networks and services, for general wireless use, and for analogue cellular).
References	This work has moved from PCCA MSC STD-101 into TR-30.4 as PN-3499.

Table 2 - References for AT command set extensions (compiled with the help of Joe Decuir, Charlie Garthwaite, Petri Heinonen and Bill Pechey)

incoming call (CLI) and log the details of the call (duration, notes...). The same application could also automatically send a short message (SMS) to another phone giving the phone number and the name of the caller, retrieved from a database. This could be used in an office with several phones when someone wants to take some time off incommunicado...

Let's face it, the world is not yet saturated with mobile communication applications. This despite the fact that all the tools are ready today to create software that would bring all the new functionality to the end user. There are lots of opportunities for the imaginative developers.

Apple™ Developers Start Here!

Have you thought about developing for Macintosh™ or Newton™? Do you need great compilers, object-oriented development tools, technical books, or simply the best possible advice on how to get started? If so, call Full Moon Software™ on 01628 660242, today!

- **Metrowerks™ CodeWarrior™** (the best C/C++/Object Pascal, native IDEs for 68K and PowerPC, application frameworks, source debuggers, on-line docs, compilers for 68K/PPC/x86): £69 to £275.
- **Object Master™** (the best source code editor/browser for C++ programming, for all major Windows & Mac compilers): from £195.
- **FaceSpan™ 2.0** (the latest version of the Mac's leading Rapid Applications Development and GUI prototyping tool): £139.
- **Language Systems Fortran** (native for 68K & PPC): from £340.
- **Brossco's Voyant™** (graphical data interface for Oracle and DAL).
- **dtF™** (royalty free Windows/Unix/Mac SQL engine): from £345.
- Programming books on Newton and Macintosh development from leading publishers, "Inside Macintosh" on CD-ROM, and many other products. Please call for details, and for advice on how to get started.

Dealer & academic enquiries welcome. Full Moon Software is trade distributor for the above products and for many other leading development tools. All prices are subject to shipping charges & VAT. E&OE.

**FULL MOON SOFTWARE
DISTRIBUTION LIMITED**

PO Box 862, Maidenhead, Berks. SL6 0QJ
Tel: 01628 660242 Fax: 01628 666084

SPECIAL OFFER!

Get started with Newton development. Everything you need in one low-cost bundle: **Newton Toolkit for Mac** (regular price £399), with an original **Newton MessagePad**. All for £199, + shipping & VAT. Order yours today!

Achieving Business Efficiency Through Object Technology

Join us for our sixth successful year in London! Don't miss the opportunity to attend innovative technical classes taught by international experts and test the latest products and services top OT companies have to offer.

The New 1995 Technical Programme

Join over 2,500 software professionals and develop your OT knowledge to its fullest potential. Still offering an assortment of introductory classes covering the fundamentals, more advanced level classes have been added providing the more experienced user an with emphasis on progressive OT issues. Learn the latest approaches and methods in:

- | | |
|--------------------------------|-------------|
| ■ Fundamentals | ■ Databases |
| ■ Client/Server & Distribution | ■ C++ |
| ■ Analysis and Design | ■ Smalltalk |

You'll Learn:

- an increased knowledge of the business advantages when adopting an OT strategy
- guidance on introducing objects into current projects
- increased levels of development productivity

Special 1995 Events

- **2nd Annual Executive Symposium** – Senior software managers can learn directly from organisations that have successfully implemented object systems into mainstream business processes. Don't miss this popular event presenting case study experiences from real users and vital commentary from independent management consultants! Register separately, seating is limited so inquire early!
- **Consultants' Information Centre** – New for 1995! This forum will address the specific information needs of consultants through an event organised by CONSULTANTS' CONSPICUOUS.
- Also, **Keynote Speeches, Walk-in Clinics, Birds-of-a-Feather Sessions, and User Group Meetings.**

State-of-the-Art Products and Services

Over 70 top vendors will fill our exhibit hall with the most advanced products and services available. Meet one-on-one with representatives and test and compare items for yourself.

- **Exclusive Product Education Sessions** include:

A few words from our competitors:

Prtblty.
Prtbilty.
Portblty.
Portabit.

No matter how they misspell it, it's still not portability. At Zinc, we understand that porting the last 20% of your code takes 80% of your time.

Only Zinc offers complete portability.

With Zinc® Application Framework™ you can develop on the platform you prefer. And since Zinc is the only one that delivers 100% portability, you'll have your application on other platforms as fast as you can recompile. It's part of what makes Zinc the most productive—and affordable—tool a programmer can use.

Productivity that leads to opportunity.

Portability is just one road you'll find a little easier. Zinc zips through tedious tasks with C++ object orientation and a unique visual development tool. Globalizing your application is as easy as translating the text. And Zinc is the only product that supplies 100% of the source code.

It all adds up to productivity. Which means more profitability. Which is a concept we probably don't have to spell out for you. For free information and demonstration software, call :

NO LIMITS

MICROSOFT SQL Server for the Microsoft Windows NT operating system is a powerful, scalable relational database platform. It offers greater ease of use and manageability (through several graphical tools) than more traditional database platforms and can be used to develop distributed client/server applications. This article discusses how to create extended stored procedures for Microsoft SQL Server.

SQL (Structured Query Language) is a high level language for relational database systems. Originally developed in the mid-1970s, SQL has been adapted for many relational database management systems (RDBMS). It has proved to be a powerful language capable of coping with some of the most intricate programming problems. A number of RDBMSs have further enhanced standard ANSI SQL by providing their own versions which introduce some aspects of procedural languages (MS SQL Server provides Trans-

Developing...

...Stored Procedures for Microsoft SQL Server

act-SQL and ORACLE provides PL/SQL). However, for some requirements, even these enhanced SQL dialects are not powerful enough.

In SQL Server, using Transact-SQL, you can gain access to a wealth of information about the SQL Server environment (the number of logins or attempted logins since start-up, the name of the local SQL Server, even the server process id of the current process). But what if you wanted to find out something that SQL Server didn't tell you, or react to a condition in a way that SQL Server didn't allow you to? Ever wanted to know what chip was inside the machine that SQL Server was running on? No? Well possibly something more useful (only just) would be the ability to invoke a mail session and send a message to a particular person based on certain conditions in your SQL Server database. The message could be built dynamically at run-time based on current values in the database.

This kind of functionality could be very useful from a business point of view. For instance it could be invoked when a company's stock levels drop below a certain level and the mail message could be an order sent directly to a supplier's fax machine. Or perhaps in a financial environment, it could be some kind of notification message indicating instrument price changes.

Microsoft SQL Server now lets you go a long way beyond standard SQL syntax. **Mike Campbell** explains how it is even possible to reach the Win32 API.

Figure 1 - Schematic diagram showing how extended stored procedures can be used to access NT services

**The Hardlock software
protection system.
Universal and individual.**

Around the world, there are currently over 1.5 million Hardlocks in use. They are all virtually hackproof, daisy-chainable, individually interchangeable, compatible, and with an almost incredible variety of forms and features, they are fast and easy to implement.

Want to know more? Want to find out which Hardlock will suit your application? Want to order the FREE Hardlock evaluation pack? No problem! Just dial...

Extended Stored Procedures

These ideas can be implemented in SQL Server by using extended stored procedures. Extended stored procedures are functional extensions that you can write and add to SQL Server. These extensions can then be integrated into your database applications to add functionality that otherwise would not be directly available.

The procedures are essentially dynamic-link libraries (DLLs) which provide a way to extend the capabilities of SQL Server using the Microsoft Open Data Services (ODS) Application Programming Interface (API). The Microsoft ODS API consists of C functions and macros which can be used to create extended stored procedure DLLs that are added directly to the standard SQL Server DLLs. Users can then call these extended procedures in the same way they would call standard stored procedures (written using Transact-SQL). From the extended procedure, the programmer can access other APIs (e.g. Win32) to provide the required processing.

Figure 1 provides a schematic diagram of how a client PC can connect across the network to SQL Server running on Windows NT and access extended stored procedures to trigger external actions.

Tools

Although an extended procedure can be written and compiled in one environment (I used Microsoft Visual C++ for windows NT), it is actually part of the client/server chain and as such, a number of different environments/platforms will be required to complete the development. The actual procedure requires a Windows NT C compiler along with the Microsoft ODS library. SQL Server for Windows NT (as well as Windows NT itself!) is also quite important as this is what you're going to plug the extended procedure into.

A Sample Procedure

The sample procedure discussed is designed to demonstrate a number of techniques using a simple example. It shows how you can:

- Validate parameters passed into the procedure
- Use the Win32 API to do some processing
- Define, create and populate a SQL Server result set
- Return the result set to SQL Server

One row of data is returned to SQL Server containing the version number and platform for the operating system that SQL Server is running on. In itself, it is not very useful but it does illustrate some important parts of

developing extended stored procedures. To retrieve the operating system information, the Win32 function `GetVersion()` is used.

As you can see from the code listings, there are actually two functions in the DLL, `xp_cbs_test_proclist()` and `xp_cbs_test()`.

The first function, `xp_cbs_test_proclist()`, returns a list of all the extended stored procedures in the DLL and their usage. The sample procedures supplied with the Microsoft ODS use this 'proclist' (procedure-list) idea which is a useful convention because it allows developers to examine

extended procedures to see what they do and how they are called. With standard stored procedures, a developer can simply open the code (using something like SQL Object Manager) to see what it does and what parameters it takes; however with extended procedures being compiled code, it becomes more difficult to get at this information.

The function `srv_rpcparams()` tells you the number of arguments that have been passed to the procedure. Unlike normal stored procedures, where SQL Server will validate user-specified parameters and return syntax errors, extended procedures

```
#include "xpTest1.h"
//=====
RETCODE xp_cbs_test_proclist(srvproc)
{
    SRV_PROC *srvproc;
    int paramnum;
    DBCHAR colname1[MAXNAME];
    DBCHAR colname2[MAXNAME];
    int i;
    // Get number of parameters
    //
    paramnum = srv_rpcparams(srvproc);
    // Check number of parameters
    //
    if (paramnum != -1) {
        // Send error message and return
        //
        srv_sendmsg(srvproc, SRV_MSG_ERROR,
            XP_CBS_TEST_PROCLIST_ERROR,
            SRV_INFO, (DBTINYINT)0, NULL, 0, 0,
            "Error executing extended stored \
            procedure: Invalid Parameter",
            SRV_NULLTERM);

        // A SRV_DONE_MORE instead of a
        // SRV_DONE_FINAL must complete the result
        // set of an Extended Stored Procedure.
        //
        srv_senddone(srvproc,
            (SRV_DONE_ERROR | SRV_DONE_MORE), 0, 0);
        return(XP_ERROR);
    }

    return(XP_ERROR);
}

    sprintf(colname1, "spname");

Listing 3 - Include file for extended procedure DLL

need to carry out this validation for themselves. `srv_sendmsg()` is used to send messages back to SQL Server and in this case is used to flag an invalid number of parameters.

Next the Win32 function `GetVersion()` is used to retrieve the operating system information. The creation of the result set to return the information to SQL Server is done using a series of ODS function calls. First, for each column to be returned, a variable of type `DBCHAR` needs to be created. In this case the variables are called `colname1` and `colname2`.

The column names are then assigned to these variables using the function `sprintf()`. Function `srv_describe()` is then used to define the column's characteristics (e.g. the data type). Once defined, data can be put into the column using the functions `srv_setcoldata()` and `srv_setcolen()`. When data has been assigned to all the columns, the result set row can be returned to SQL Server using function `srv_sendrow()`. When all rows have been returned, the function `srv_senddone()` is called to signal the end of the result set.

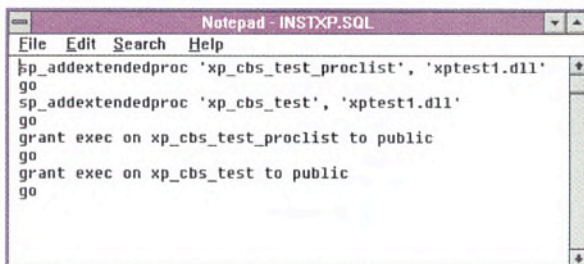

Figure 2 - Adding a procedure to SQL Server

Once written, the procedure needs to be compiled into a dynamic-link library. The ODS library (OPENDSNT.LIB) needs to be linked in as well to support the ODS function calls used. The final DLL file can then be copied into the SQL Server DLL directory and is ready for use.

The code in Listing 3 shows the header file for the extended procedure.

Calling the Sample Procedure

Before running the procedure, it needs to be added to SQL Server using an SQL script. This needs to be written in SQL Server Transact-SQL language and can be created in Notepad or any other text editor. Figure 2 shows a script for adding the sample procedure.

There are a variety of ways in which extended stored procedures can be accessed but probably the simplest way, especially while developing the procedure, is to use SQL Object Man-

ager which comes with SQL Server. Figure 3 shows SQL Object Manager running the procedure and the results returned.

Alternatively, you could choose to build an application from a number of front-end (client) tools available (e.g. Visual Basic or Access) and call your extended procedure from this application. To connect to SQL Server over the network you would have to use some kind of connectivity layer like the Microsoft Open Database Connectivity (ODBC) API or DB-Library.

Conclusion

Extended stored procedures provide a very powerful mechanism for extending the functionality of SQL Server. Because executing an extended stored procedure is similar to executing a standard stored procedure, the consistency of the interface makes them

easy to use for the SQL Server user. Administration of extended procedures is also easier because they can be added or dropped by the system administrator in the same way as standard stored procedures.

By accessing the Win32 or other APIs, an extended stored procedure can be made to do almost anything a conventional C program can do. As you can imagine, the possibilities are endless and only limited by the imagination and skill of the developer.

These extensions allow you to develop applications that match business processes much more accurately and also allow you to automate more of these processes, making SQL Server suitable for a wide variety of business uses. ■

AP PROFESSIONAL

Helping to create the new media age.

WebMaster

Create your own WWW site today! The definitive step-by-step guides for turning your Macintosh or Windows-Based PC into a WWW server in a matter of hours. We've even included all the software on CD-ROM needed to make it happen.

July 1995, £19.95,
Macintosh Version: 0-12-445574-3,
Windows Version: 0-12-445572-7

Netscape Navigator

Covers everything you need to know to master Netscape Navigator 1.1, including software on the CD-ROM to unleash it's full multimedia potential.

July 1995, £19.95,
Macintosh Version: 0-12-553130-3,
Windows Version: 0-12-553132-X

Internet Edge in Business

Outlines what the Internet is and thoroughly explains how it may be used to enhance your business's efficiency and accessibility on the Internet. Includes a CD-ROM with a special business toolkit to get any DOS or Mac machine on-line.

July 1995, £19.95, 0-12-737840-5.

Agents Unleashed

A valuable toolbox for anyone interested in intelligent agent technology, it describes a model agent system, introduces digital cash and the digital economy and features a software agent on the enclosed disk.

June 1995, £29.95, 0-12-738765-X

Newton

"If your curious about developing Newton applications but don't want to pay \$800 for the Newton Toolkit (NTK), Programming for the Newton deserves attention."

- Intelligent Newton Magazine

Programming for the Newton, 1994, £23.00,
includes NTK demo, 0-12-484800-1

Now Available! Wireless for the Newton: Software Development for Mobile Communications

June 1995, £24.95,
includes NTK demo, 0-12-484801-X

HyperText Markup Language 3.0

The evolution of HTML has been led by Web site developers. HTML 3.0 is the proposed new version that incorporates many of the features that they have requested. **Paul Richardson** has a go at them.

It seems like only yesterday that I was writing my last article on HTML (*EXE December '94*); however, in the realm of the Internet, things don't stand still for long. Now that the big money in commerce has recognised the potential for gaining a competitive edge through WWW technology, Web page developers are clamouring for new features in HTML that give them more control over the presentation of the material they publish.

The missing features most asked for were: table support, the display of mathematical expressions and text flow around figures. It should come as no surprise that the draft specification for HTML 3.0 tackles all these issues and more.

Given that HTML 3.0 is no more than a draft Internet Engineering Task Force (IETF) document, it may seem too early for a whole article; however, HTML 3.0 has been under consideration for some time, and support for many of its features has already found its way into existing browsers (eg. Netscape).

The new features have added considerable complexity to the language, and a full reference guide would be the subject of a small book. Hence this article cannot be a complete specification but it should give a flavour of the new capabilities of the language by introduc-

ing new concepts. For the full specification, follow the links in the bibliography.

HTML history

The features contained in the various versions of HTML is not a precise matter as firm specifications and versioning have only recently been applied. However, in a hand-waving manner, it is possible to say that HTML 2.0 is what we have become used to seeing supported by the traditional mainstream browsers such as Mosaic. HTML 1.0 was essentially the same as version 2.0 without the capability of user input via forms.

For quite some time now, say 18 months or so, the idea of *HTML+* has been batted around, provoking discussion of what should be in the version of the language that succeeds HTML 2.0. It was only on the 28th March 1995 that the fruit of all these discussions was put forward by Dave Raggett as a representative of the World Wide Web Consortium to the Internet community in the form of an Internet Draft entitled *HyperText Markup Language Specification Version 3.0*.

Internet Drafts are the working documents of the Internet Engineering Task Force, and as such will be subject to modification before being ratified as the specification to adopt. However, the fact that the *HTML+* specification has been around for some time now and that many of its features have been implemented in Netscape, ensures that much of its content is a de facto standard already.

This last point is actually the source of a great deal of discontent in the Internet world. It is felt that Netscape Communications (authors of the Netscape browser) have run ahead of the process of standardisation and implemented features in an ad hoc manner. While many of us might be tempted to say that they are only implementing features that we all want to see in a browser, it should also be appreciated that one of the underpinning strengths of

the WWW is its platform and vendor independence, and threatening this tenet is likely to upset a lot of people.

HTML 3.0 is described as being 'broadly backwards compatible' with version 2.0. Enough said on the history!

General features in HTML 3.0

In HTML 2.0, most tags relate to both presentation and content, for example `<I>...</I>` denotes italicisation while `<ADDRESS>...</ADDRESS>` indicates to the browser that the enclosed text is an address. One of the motivations behind the new tags in HTML 3.0 is that they should relate to the content of the bounded text, not the intended presentation. This choice of emphasis has only been made to reinforce one of the principles of the WWW, that the information served should be capable of being presented in a variety of environments which may not be capable of dealing accurately with presentation tags. This is particularly important when a browser must work with text terminals or even non-visual output devices such as speech processors. When a speech processor encounters an `ADDRESS` tag, it can preface the address with the words 'The address is as follows', but what should it do when it stumbles upon an italic tag?

Marking-up content is also important for applications which automatically process text, such as search engines that build databases of the titles of WWW documents or an -hypothetical- application that searches all Web documents in order to collect addresses. A list of the content tags, or *content elements* as they have now formally become known, is in Figure 1.

Internationalisation

There is a MIME type, `text/html`, associated with HTML documents. You may remember from my article about MIME (*EXE October '94*) that the `text` content type takes a `charset` parameter. By setting this parameter accordingly, the document text may be displayed with a wide variety of character sets. In practice, it will be the default character set that is used, which for the `text/html` content type/subtype is ISO-8859-1 if the text contains 8-bit characters, and straight US-ASCII otherwise. The ISO-8859-1 character set is also known as Latin-1 and contains the characters used by most Western European languages.

For 8-bit characters that are precluded, an alternative means of denoting these special characters has to be used. HTML 3.0 provides two mechanisms for doing this; first it includes tags called *entity references*

Conducting Client/Server with Lotus Notes® ?!

When it comes to a choice of database platform Lotus Notes is not the first which springs to mind. You've probably already got plenty of experience with DBFs, Access or even Oracle or Sybase. So what's so special about it and where would you want to use it?

- Unstructured data with OLE support.
- Client server supported on Windows, NT, OS/2, Netware and several flavours of Unix.
- Database replication making WAN implementation a cinch.
- Powerful and flexible security features
- A wide choice of communications protocols including IPX, NetBIOS and TCP/IP..
- A choice of development environment to fit in with the way you want to work: Maestro's object oriented support for C/C++, Visual Basic, Delphi (soon), and of course, Notes ViP and the Notes editor itself.
- The option of handling Internet newsgroups and Web publishing.
- Oh yes, you do get Email thrown in for free.

Globebyte Maestro Professional extends Microsoft Visual Basic and Borland Delphi to allow the development of stand alone **Lotus Notes** sourced applications. It includes a fully functional user view object 100% compliant with Notes view and just as fast. It allows user and programmatic access to all rich text information including OLE and file objects and document links. It provides access to the **Lotus Notes** full text searching engine, unread document information and the **Lotus Notes** mail engine. Using **Maestro**, all embedded **Lotus Notes** macros can be run from within the external application. **Maestro** ships with over twenty example apps and is totally royalty free.

 CIRCLE NO. 204

You can get a Full **Lotus Notes**® Client, **Maestro** Desktop for Visual Basic and the Lotus Developer's Toolkit, all for just £375 (plus VAT and shipping). Offer ends 31/07/95. Alternatively, just call for the technical lowdown.

See for yourself. Call 0181 994 4842

QBS Software Limited, 10 Barley Mow Passage, London W4 4PH Tel: 0181 994 4842 Fax: 0181 994 3441

such as `<acute>`. These tags also provide a means of displaying characters from a char-

acter set other than the one being used. The other means is through *numeric character*

references, whereby any character can be represented by its character set entry number with the syntax `&#nnn;`.

Tag parameters

The practice in previous versions of HTML of specifying additional parameters to a tag, such as the `align` parameter in an `img` tag, has been both extended and made more regular. Most tags now take several parameters (also known as attributes), and many of these parameters are common to several tags. At this point in the article it is worth introducing some of the more common parameters.

The most common parameters for tags that can appear in the body of the document are `id`, `lang` and `class`. The `id` parameter allows the author to mark the point in the text with a unique name that can be used as a target for hypertext links. The `lang` parameter specifies the language that the enclosed text is in, so generally it will be specified only once as a parameter of the `body` tag. For instance, to specify UK English, the parameter is `lang = en.uk`.

The last of these parameters, `class`, is an important feature as it paves the way for a great degree of flexibility in marking-up content and presentation requirements. Simply put, it allows the author to subclass the tag to be more specific about the content type or to reference a class in an associated style sheet that specifies the desired presentation.

The `align` attribute performs much the same role as it used to do, i.e. specifying the horizontal alignment of an entity, but it has now been extended both in capability and in applicability. In general it takes one of the values `left`, `center` (sic), `right` or `justify`.

The parameter `nowrap` indicates that the browser should not be allowed to wrap text as and when the whim takes it, and hence control over wrapping is put back into the author's hands, who may use the `br` tag when a line end is required.

The `clear` attribute has become necessary because of the introduction of another HTML 3.0 feature, that of wrapping text around figures. `clear` can be applied to any block structure, such as a paragraph, and specifies that the text should not wrap around the figure, but rather *clear* it, hence the name. It has a number of subtleties.

The `src` and `md` attributes go hand-in-hand. `src` specifies the URL of an image that is to be included in the text. It can be used in a variety of situations, not just with the `img` tag (the most common situation). For instance, it can be included in a list to specify customised bullets. `md` stands for Message Digest. It gives a signature for the image

A	A hypermedia jump (anchor)
ABBREV	An abbreviation
ACRONYM	An acronym
ADDRESS	An address
AU	An author
BANNER	Information that should not scroll with the body text (i.e. always visible)
BODY	This marks the main body of text (i.e. not the HEAD)
BQ	An extended quotation (used to be BLOCKQUOTE)
CAPTION	Labels a figure or table
CITE	Specifies a citation
CODE	Indicates an example of code
CREDIT	Names the source of a block quotation or figure
DD	Defines a term in a term definition list
DEL	Marks deleted text
DFN	Indicates the defining instance of a term
DIR	A style of list (superseded by new features to the UL element)
DIV	To represent different kinds of containers, e.g. chapter or section
DL	A list of terms and corresponding definitions
DT	Specifies a term name in a term definition list
FN	Marks a footnote
FORM	Indicates that the page is a fill-in form
H	Marks one of six levels of header
HEAD	Marks the extent of certain header elements
HTML	Indicates that this document is HTML
INPUT	Marks a fill-in field in a form
INS	Denotes text that has been inserted
ISINDEX	Informs the HTML browser that the document is an index document
KBD	Indicates text typed in by the user
LANG	Alters the language context
LH	Marks a list's title
LI	Indicates a list item
MATH	To include math expressions
MENU	Another style of list (superseded by new features to the UL element)
META	To embed document meta-information not defined by other elements
NOTE	For admonishments such as notes or warnings
OL	Marks a numbered list of items
OPTION	Used in conjunction with SELECT to represent one of several user choices
PERSON	For names of people
Q	For a short quotation
RANGE	Marks a range of the document
SAMP	Indicates a sequence of literal characters
SELECT	For single and multiple choice menus
TABLE	Denotes a table
TD	Table data cell
TEXTAREA	Lets users enter more than one line of text
TH	Table header cell
TITLE	Identifies the document
TR	Marks a table row
UL	An unordered list
VAR	For a variable name

Figure 1 - A list of content markup elements

ABOVE	Draws an arrow, line or symbol above an expression
ARRAY	For matrices and other kinds of arrays
ATOP	Used when you want to place one thing above another, without the dividing line
BAR	Draws a line over the enclosed term
BELOW	To draw an arrow, line or symbol below an expression
BOX	For hidden brackets and placing one term over another
BT	Overrides the default rendering and indicates a bold, upright font
CHOOSE	Places one term over another, with a divider and enclosed in brackets
DDOT	Draws a double dot over the enclosed term
DOT	Draws a single dot over the enclosed term
HAT	Draws a circumflex over the enclosed term
ITEM	For data items within the ARRAY element
LEFT	Used with delimiters that are to be placed to the left of an enclosed term
RIGHT	Used with delimiters that are to be placed to the right of an enclosed term
ROOT	Specifies arbitrary roots of an expression, eg. cube root
ROW	Marks rows within the ARRAY element
SQRT	Indicates the square root of an expression
SUB	Marks a subscript
SUP	Marks a superscript
T	Overrides the default rendering and indicates an upright font
TEXT	To include a short piece of text within a math element
TILDE	Draws a tilde over the enclosed term
VEC	Draws a right arrow above the term

Figure 2 - A list of mathematics markup elements

NEWS

- New Nu-Mega** - BoundsChecker Win ver 2.5 and BoundsChecker 32/NT ver 1.5. Don't forget BoundsChecker & Soft-ICE/W beta's available for Win '95.
- Delphi** - Competitive upgrade offer.
- Delphi** - RAD Pack with Visual Solutions, VCL Source, Resource Workshop
- NAG** - we now carry NAG Numerical libraries for Fortran and C, NAG Fortran 90 and NAG Statistics packages.
- Btrieve** for Windows NT development Kit and new Netware server now shipping.
- VBA Companion** for OLE automation, VBX and OCX tracking

WE HAVE MOVED

please note our new address

BASE	Gives the base URL for dereferencing relative URLs
FIG	An enhancement of the existing IMG element
LINK	Indicates a relationship between the document and some other object
OVERLAY	Is used to overlay images on top of a base figure
STYLE	Provides a means for including rendering information (see text)
TAB	Used when you want fine control over the horizontal positioning

Figure 3 - A list of notable miscellaneous markup elements

```

</TABLE>
```

Figure 4 - A table in HTML 3.0

specified by src, so that it can be ensured that the original graphic image is loaded.

Tables

The ability for a WWW browser to display tables of information has been discussed for quite some time now. HTML 3.0 formalises the de facto standard for expressing tables, as already implemented in the various Netscape browsers. The tags used to support tables are found in Figure 1, among the other content type tags, the primary ones being TABLE, CAPTION, TR, TH and TD.

A point worth noting is that the size of a table is determined by a complex algorithm based on the cells' content and the current window size. The algorithm can be overridden by the COLSPEC attribute.

Tables can contain a wide range of content such as headers, lists, paragraphs, forms, figures, preformatted text and even nested tables. Figures 4 and 5 demonstrate the use of the table tags and shows off some of the fancier features.

The TABLE tag takes a BORDER parameter which specifies whether a border should be present or not. A borderless table is particularly suitable for layout purpose as well as for tabular data, for example to create a fill-out form in which the input fields and their descriptions are aligned one over the next.

Mathematical equations

The challenge for HTML developers in producing a specification for the markup of mathematical equations was to produce something that was simple, yet powerful and did not simply duplicate the work of existing specifications.

The list of 23 tags that have been proposed are listed in Figure 2 along with a brief description of their effect. Any mathe-

matical expression is bounded by the MATH tag, within which any of the other tags can be used. The specification draws a lot on the math mode in LaTeX, so if you are familiar with that software, you are more than half-way there. One of the most powerful tags is box which is used when an expression needs to be bracketed but the brackets are not to appear in the presentation. The following example shows how to write mathematical expressions in HTML 3.0.

Expressed in English 'the integral from a to b of f(x) over 1+x' is specified in HTML by

$$\int_a^b \frac{f(x)}{1+x} dx$$

Note that the standard abbreviations '_' and '^' represent respectively subscripts and superscripts.

Style Sheets

Style sheets seem to be a powerful concession to those authors who are primarily commercial publishers rather than simply information providers, in that they give a great degree of control over the finished look of the document. However, the provision of an accompanying style sheet allows the basic HTML text to be relatively free from the trappings of presentation, and instead be marked-up primarily on content.

At present there is much work to be done before a viable reference implementation can be made available, but it is useful to explore the framework of the proposal.

Styles for presentation tags (e.g. headers H1 to H6) are drawn from a variety of places, namely the browser's configuration, a linked style sheet (specified by the LINK tag) and style information present in the STYLE tag contained in the document's header. The styles specified in the document header will override styles drawn from elsewhere, even the browser's defaults. They give the author control over some aspect of presentation that they feel strongly about.

As a final twist to this stylish tale, by using a block tag's STYLE parameter it is possible to associate a different style just for that instance of the block, e.g:

```
<h2 class=bigcaps>Header with bigger than
normal capitals</h2>
<p class=abstract>A paragraph with a
unique style of its own ....
```

Existing HTML 3.0 software

HTML 3.0 is still a draft specification. However if you wish to make use of HTML 3.0 software for either authoring or viewing, there are some programs around that will help. Two browsers are available, one from the commercial camp and the other from the field of research.

Arena is the official HTML 3.0 testbed browser being developed by the WWW Consortium. It has been made available to all in binary form, though only for a number of Unix platforms. It is an ongoing effort that is evolving as the specification stabilises, and at present provides the most comprehensive support for HTML 3.0 browsing. See the bibli-

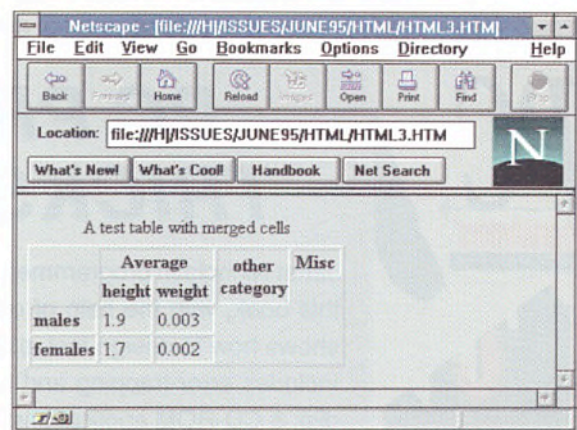

Figure 5 - The code in Figure 4 displayed with Netscape 1.1N

ography for details of how to obtain Arena.

Netscape Communications has been forging ahead, implementing a mixture of HTML 3.0 and proprietary extensions. Of the HTML 3.0 features supported, the most significant is a fairly complete implementation of tables. Another HTML 3.0 feature supported is that of author specified backgrounds, allowing something other than the default grey.

However it's Netscape's proprietary extensions that have drawn the strongest response from the Internet community, with claims that Netscape is trying to capture the market for itself by introducing features which have not been agreed on by the IETF. In particular, one of the most radical additions is that of being able to *push* data to Netscape, thus introducing two new facets to the WWW, that of browsers that listen for connections and the concept of a session with an HTTP server. These extensions, while facilitating applications such as animation and information that is regularly updated, are controversial because they strike at the heart of the nature of the Web. They challenge such tenets as having a lightweight one-shot interaction with a server, and keeping bandwidth usage to a minimum.

Arena Information	http://www.w3.org/hypertext/WWW/Arena/
Netscape Browsers	ftp://ftp.netscape.com

The commercial influence behind the introduction of such features is unmistakable as Netscape Communications strives to be the foremost provider of browsers to the world, and as they bow to the pressures of marketing executives who are not so much concerned with marking up the content of the material they publish, as being able to have precise control over how the information is presented to the viewer. With so much money being spent on corporate images and the need to be able to establish a visual identity, the last thing that on-line advertising agencies want is for the pages that they produce to share similarities with other companies' pages, or for the final look to be at the mercy of the viewers preferences.

Participating

As I came to terms with the new features in HTML 3.0 I couldn't help thinking that I

was glad for the introduction of word processor add-ons, such as those from Microsoft and Quarterdeck, because to make use of the more advanced features it will be necessary to use tools that are more sophisticated than writing HTML in a text editor. The results, though, of using a more complex mark-up language will, I believe, be worthwhile.

If you want to get directly involved in evaluating HTML 3.0 then I suggest joining the mailing list mentioned in the bibliography: you are quite entitled to do so. The process is one that is open to any interested party.

NEW BOOKS FROM SIGMA PRESS

BUILDING WINDOWS HELP SYSTEMS

This is the definitive guide to building your own help systems. It's written by documentation specialist Malcolm Addison and covers every aspect of producing Help files from their initial design through compilation to testing. Case studies and extensive appendices complete this excellent book. *"The fact that no-one else has seen fit to produce a book on Help systems is nothing short of amazing"* - Sean Geer, Windows Magazine. **£16.95**

PC PROGRAMMERS' TRICKS OF THE TRADE

Janet Nicholson programmed the highly-acclaimed BBC Gardeners' World 3D-Designer. In this book, with the help of over four thousand lines of carefully-documented code, she shows how to design fast, efficient & reliable C++ programs for commercial applications. Includes error trapping and handling; flicker-free graphics; scrolling and pop-up menus; disk & CD-ROM applications; code testing; rolling demos. **£14.95**

Sigma Press books are available from all bookshops or direct from us by post or phone - pay by cheque, ACCESS or VISA. Please add £2 towards p&p for single orders - p&p free for two or more books.

FOR COMPUTER PROFESSIONALS

Productivity Headache #69: Check-list items that don't check out.

When selecting a tool, you make sure it has all the "Hot Items" on your check-list. But how many will turn out to be not-so-hot?

Get a Codewright Programmer's Editor.

Take Templates. Not C++ templates, but "Syntax Expansion", "Construct Forms". Call them what you will, every decent programmer's editor since BRIEF has them. You type in "for" and the editor inserts the basics of a loop construct. Templates are a check-off item. But how many programmers actually use them?

Most programmers try to use templates, but turn them off after finding they get in the way. The templates put braces in the wrong place, or don't follow your style guide. If you can't change templates easily, you'll be more productive just turning them off.

The Cure:

Imagine Templates that save you time.

Codewright Templates take the drudgery out of typing in language constructs. Codewright lets you quickly select from the most common styles of brace placement. If that's not enough, you can easily change the template definition on-the-fly. No need to learn a macro language, or compile anything. Now that's the kind of templates you can use!

Turn Templates into Power Templates.

Codewright Templates are not just usable. They have the power to do real work, too. They can pause to prompt you for a function name, insert the current date or some

boilerplate from a file, even paste the contents of an environment variable. You can even execute any of 1000+ functions, or your own function from within a template.

Features that won't burst your bubble.

Codewright templates are an exclusive feature of Codewright Editors: Codewright Fusion, the editor that is a drop-in replacement for the editor in the Visual C++ environment; and Codewright Professional, the comprehensive editing solution.

For more information about this feature and other ways the Codewright Editors will make you more productive, call now.

Anatomy of a Spreadsheet

When building applications, selecting a spreadsheet to handle your data is important. You want flexible formatting, easy reporting, a quick calculation engine, and the ability to place pictures, graphics, and controls directly on your worksheets. And you want an easy-to-use interface.

With Formula One, you get all of that and more.

Formula One is the best spreadsheet component you can buy for building Windows-based applications. Its unmatched functionality includes Microsoft Excel compatibility. Try finding that in any other spreadsheet or grid tool.

You get VBX and DLL interfaces plus support for MFC and OWL developers with libraries and header files. Perfect for development in Microsoft Visual Basic, Visual C/C++, Access, Borland C/C++, or Delphi.

Now Available in
16-Bit
and
32-Bit
Versions!

Import and Export Excel Worksheets

It's like giving away Excel as part of your application at no additional cost per user and at a fraction of the resources consumed by a standalone spreadsheet.

Connect to Databases

Formula One is a perfect database tool for displaying and updating database records. Plus, you can use Formula One in BLOB mode to create a database of worksheets.

Draw Controls Directly on Worksheets

Create buttons, check boxes, and drop down list boxes and place them anywhere on your worksheets. Plus, specify input cells to set and record the current selection of your controls.

126 Built-in Worksheet Functions

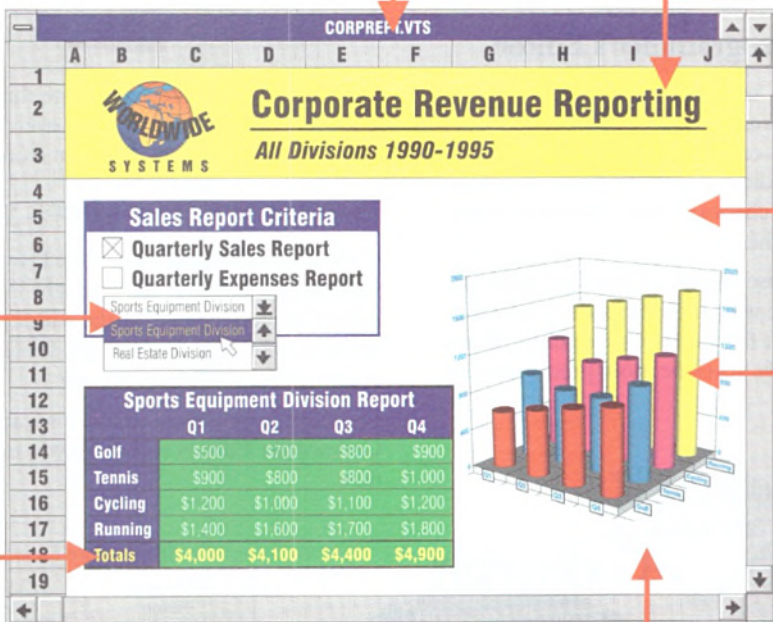

Formula One includes the most complete set of worksheet functions available in a spreadsheet component for data calculation and evaluation. Includes a wide variety of business and mathematical functions. And they are all Excel compatible!

Royalty-free Runtime License

Compare the cost of developing applications with Formula One to the cost of using standalone spreadsheets and your choice is clear. Formula One's royalty-free runtime license lets you develop and distribute applications at a fraction of the cost.

Place and Update Metafile Picture Objects

Use this feature to include charts from First Impression in your worksheet reports. Plus, the easy-to-use link with First Impression lets you chart any Formula One data.

Lightning Quick Spreadsheet Engine

No other spreadsheet or grid tool is as fast at entering data, recalculating formulas, reading and writing files, or copying, inserting, deleting and sorting worksheet data. Benchmark tests show Formula One is as much as 4000% faster than other tools. That's fast!

All about processes... ...well nearly

It seems to me to be time for one of those 'this is how it all hangs together' columns. I've chosen to talk about how processes live: what happens when you login, how signals are handled, the idea behind process groups and the new POSIX notion of sessions. Much of this is invisible, or at least appears to work in a way that doesn't reflect how things actually do operate. For example, shells apparently support background and foreground processes. In reality, there is little distinction as far as the kernel is concerned. The foreground/background idea is managed by some co-operation between the shell, the terminal driver in the kernel, and the process itself.

Like many aspects of UNIX, all of this has evolved with time. Many system calls that exist today are there because some new need that was identified causing changes to be made to the original design. Of course, history shapes current systems in a huge way. Each change has had to be done in an incremental way, so that old programs don't break. In addition, the POSIX committees have often taken on themselves to invent a new 'sensible' solution when the two main strands of UNIX have diverged. By now, systems are generally converging towards the POSIX way of doing things.

What is a process?

A process is a running program. The kernel sees a process as three distinct pieces: the binary code of program and its associated data area, the stack where volatile data is stored, and a control page called the **u-area**. The process itself uses a model which usually maps onto the architecture of the underlying machine. The application programmer, using

a C compiler (or whatever), can usually act as though his program is running on the raw machine without OS interference. This point is emphasised by the fact that the kernel - a program that really *does* run on the raw machine - is usually a binary created using the same tools as an ordinary program.

The use of a direct mapping onto the machine is one of the reasons why UNIX source for simple programs port relatively easily into other operating systems. Of course, the program has to interact with the external world, perhaps reading or writing data, and this is done via system calls that trap into the kernel.

Processes have protected address spaces. They cannot write to the address space of any other process, nor can any other process trample on their address space. In fact, on most architectures these days, a process cannot write into its own program space. Processes can only interact with other processes and the outside world via system calls. Special system calls exist to allow one process to trace another for debugging purposes, and these work using a time-consuming handshake mechanism where the controlling process hands some magic data to the process being traced, and the traced process runs some glue code itself to do the work of setting things up for the controlling process. The point here is that processes can only deal with their own address spaces and need to run code themselves to change their own data.

A similar set of rules apply when a process is sent a *signal*. A signal is an external event that is sent to a process, often by typing a control key on the keyboard. The event may be

The only certainties are birth, death and being a zombie... **Peter Collinson** takes us through the highlights of the life of the humble process, showing how it has changed as UNIX itself has evolved.

interpreted in different ways by the process. The process can choose to trap it, or leave it to be handled by the default code in the system. The default code is part of the kernel, but is run by the process itself.

When a signal is sent to a process, the kernel posts it by setting a bit in the **u-area** of the process. Next time the process gets a turn at the CPU, it will jump into the signal handling code, decide what to do with the signal and continue or die depending on how things are set up.

A process is created using the **fork** system call. Its job is simply to clone an existing process. I suspect that this was done in the early systems because it was easy. To **fork**, all you did was to swap the whole process out to disk, but not free the space that it occupied. A new **u-area** was created by copying. The final tidying was to change the number of the process (the process id or **pid**) to a new one, fix a few reference counts and you were done. This was cheap operation because you could point the disk hardware at a section of memory and say 'copy that'. The swapping out happened with no intervention of the CPU.

The new process is the 'child' and the old one the 'parent'. There's one difference between the two processes: the **fork()** system call returns zero in the child, and returns the child's **pid** in the parent process. This allows us to run different code in each copy of the program. The child usually then calls the **exec** system call which will throw away all that carefully copied address space, pull in a new binary from a file and start running it. However, notice that this allows the new program to inherit the **u-area** contents of the original process.

MAKE YOUR JOB EASIER WITH NEW BOOKS ON SYSTEM ADMINISTRATION AND PROGRAMMING

O'Reilly is known worldwide as the leading publisher of books on UNIX, the Internet, and the X Window system. Our books are easy to understand and will show you, step-by-step, how to get the job done. Shown here are five new titles that will help you do just that. You won't find a better source of information on topics ranging from creating your own Internet service, setting up a secure email system, or building a Linux network.

Managing Internet Information Services: World Wide Web, FTP, Gopher, and more

By Cricket Liu, Jerry Peek, Russ Jones, Bryan Buus & Adrian Nye
1st Edition December 1994
668 pages, ISBN 1-56592-062-7
£21.95

Comprehensive guide describes in detail how to create services for the millions of Internet users. Ideal for the system administrator and the person responsible for creating the information that the service presents.

PGP: Pretty Good Privacy

By Simson Garfinkel
1st Edition December 1994
430 pages, ISBN 1-56592-098-8
£18.50

A technical user's guide and a fascinating behind-the-scenes look at cryptography and privacy. Describes how to use PGP and gives background on cryptography, history, battles over public key cryptography patents, and U.S. government export restrictions.

POSIX.4: Programming for the Real World

By Bill Gallmeister
1st Edition January 1995 (est.)
400 pages (est.)
ISBN 1-56592-074-0
£21.95

Covers the POSIX.4 standard for portable real-time programming. Also provides a general introduction to real-time programming and real-time issues: the problems software faces when it needs to interact with the real world and how to solve them. Includes problem sets, answers, and references manual pages for all functions and header files.

Linux Network Administrator's Guide

By Olaf Kirch
1st Edition January 1995
370 pages, ISBN 1-56592-087-2
£18.50

Describes the UNIX-compatible operating system that runs on personal computers. Touches on all the essential networking software included with Linux, plus some hardware considerations.

Exploring Expect: A Tcl-based Toolkit for Automating Interactive Programs

By Don Libes
1st Edition December 1994
602 pages, ISBN 1-56592-090-2
£21.95

Written by the author of Expect, this is the first book to explain how this new part of the UNIX toolbox can be used to automate Telnet, Ftp, passwd, rlogin, and hundreds of other interactive applications.

To order or for more information: International Thomson Publishing
Berkshire House 168-173 High Holborn London WC1V 7AA tel: 071-497-1422 fax: 071-497-14260

When systems such as the VAX, that used paging rather than swapping came in, `fork/exec` became expensive, because it meant touching all the pages in a process to copy them. It was better to just create a new set of page tables for the child that pointed at the old ones. A first attempt at making things faster was the `vfork` system call, where the child ran using the same pages as the parent. This was aimed at the case where a `fork` was followed quickly by an `exec`. The `vfork` call was limited and dangerous: you needed to be careful what code you ran in the child before the `exec` system call was executed, otherwise you could adversely affect the operation of the parent.

The key solution was 'copy-on-write'. The child's page tables are copied from the parent, so two processes have a pointer to every page. If either tries to write to a page, then a copy of the page is made, so each process now has a different set of data. This solution took some years to develop, and in retrospect, it seems so simple that one wonders why it took so long. That's the trouble with many simple ideas.

The parent/child relationship between processes is important. The most common case is when a parent launches a child and waits for it to die before proceeding. The parent uses the `wait` system call to sleep until the child dies. When a child decides to die, it calls the `exit` system call and enters so-called 'Zombie' state. This state exists because the child has some statistical information that is passed back to the parent. The information is returned immediately to the parent if it's sitting and waiting. Otherwise, the zombie will persist until the parent calls `wait`, a process often known as reaping dead processes.

The question 'Why can't I kill a zombie?' is on most UNIX Frequently Asked Question lists. The point is that the process has actually died and has no code left to handle the signal. It's waiting for its parent to call `wait`. If this doesn't happen, then the zombie will hang around for ever. If you kill the parent, then the 'Rule of One' applies - all orphaned processes become the children of process 1 (usually called `init`). Process 1 will call `wait` fairly quickly and so the zombie will go away.

Getting things started

The fact that each process inherits some state from a previous ancestor leads onto the ques-

tion of how things start. In System V this has changed somewhat from the original UNIX Research releases, while BSD derived systems have remained similar. Let's talk about where things started.

The first real process on the system is process 1. It's created by the kernel and runs a user-level program `init`. This program handles system bootstrap, runs the `/etc/rc` files through the shell and finally starts looking for terminals. The selection of terminals is controlled by a text file called `/etc/tty`, and whose contents have altered over the years.

In the early systems, people mostly logged in on serial lines and it was important to set

the data transfer characteristics (speed and parity) before coherent conversation could take place. So `init` read the terminal characteristics from the file, `forked` once for each terminal, opened the terminal, and `exec'd` to `getty`. The fact that 'Getty' is the name of a US petrol company with big signs all over New Jersey is not a coincidence.

The opening of the terminal here is important. Each UNIX process that talks to a user has a 'controlling terminal'. This is mostly used for signal management. When the user hits the interrupt key it is sent to all the processes who share that controlling terminal. (Actually, that's the way it used to be. This has now changed with the invention of job control, explained below.) The controlling terminal is also the way that the `/dev/tty` entry speaks to your terminal. The controlling terminal is established by the `open` routine in the terminal driver. If the space in the relevant structure is empty, then a pointer to the terminal is added. So the controlling terminal is the first piece of system state that the user process picks up.

The job of `getty` is simple. It adapts to the speed of the terminal and accepts your login name. This is mostly defunct now, because modems will do speed adaptation for you. Once

`getty` has an intelligible string, it `execs` to the `login` program. The `login` program validates the user, sets up various strings in the environment (like `USER` and `HOME`) and `exec` to the user's chosen shell. The program will also ensure that file descriptors 0, 1 and 2 are established to point at the current terminal ready for the shell to use as the standard input, standard output and standard error channels.

There's a little bit of magic when the shell is `exec'd`. The shell is loaded with its 'zeroth' argument (the command name) set to begin with a minus character. This is impossible to do from a normal command line. Shells use the minus character as cue to take special action for users at login time. The shell now takes over. It probably runs a setup script and hands the user a prompt which says: 'OK you can go ahead'.

There are some things to notice about this. The only `fork` that is involved is the initial one that started `init` listening on the terminal. The shell starts using the same process id as the original `init` clone. When the user exits from the shell, `init` knows that the line needs resetting because its `wait` system will return with a `pid` that it originally created.

As I said, this is the basic pattern sequence still in use today in BSD-derived systems. System V changed this for all terminals other than the console, using `ttymon` rather than `getty`. It's the `ttymon` program rather than `init` that is responsible for handling terminal lines. In effect part of the original `init` process has been moved into a separate process.

Process groups

The early systems had no notion of a login session - you could run the `login` program at any time to become a new user. There was also no real idea of background and foreground processes. When you started something in the background using the `&` syntax, then its controlling terminal was still your console. The background process could write to the console at any time. Worse, it could read from the console and you could end up typing lines of text into two different programs from the same keyboard.

A process started with `&` ignored the Interrupt and Quit signals that were sent by your keyboard, so at least it didn't terminate if you interrupted some program that you had started without an ampersand. However, if

your line dropped, all the processes were sent a Hangup (HUP) signal and this would kill background processes. This could be inconvenient and gave rise to a command (`nohup`) whose job was to ensure that a background process was not killed when you logged out.

The next step was the creation of *process groups* to help with the dispatch of signals from the terminal to all the processes that needed to get them. When an invocation of `init` opens the terminal for the first time, the process id is recorded as the process group id in the process's `u_area` and is inherited by all descendants of the original process. The terminal driver also records the process group id in its data structure. When the driver wants to send a signal to the process group, it uses this stored number to search through all the processes on the system looking for processes that are in the relevant process group.

Jim Kulp of IIASA in Austria used this to good effect with the creation of job control. When the shell launches a command or a command pipeline as a 'job' in the background, he arranged for this job to have a different process group from that recorded in the terminal data structure, so processes in the job do not get the signal. Moving a job from the background to the foreground is simply a matter of changing the stored process id in the terminal data structure.

Two other bits of glue are needed in the terminal device driver to make job control work nicely. First, if a process attempts to *read* from the terminal but that process is not in the same process group as the terminal, then the process is put to sleep. The user can now arrange which job takes terminal input. Second, if a process attempts to *write* to the terminal, and is not in the same process group as the terminal, it can also be put to sleep. This was made to be optional and controllable by an `stty` option, because mostly people don't mind some output from a background process.

Of course, the shell needed modification to support job control. For many years, only `cs` had these changes. The Bourne shell was not altered (it was written in C, but C heavily overlaid with C pre-processor macros making it look like Algol 68 - the effect was one of encryption). We had to wait for the Korn Shell and latterly `bash` to provide full job control in a shell with Bourne shell syntax. However, only the shell requires modification: no other user processes are affected by job control. This was a great plus.

In fact, putting the process to sleep was implemented by a signal sent to a background

job so that the whole job was stopped. Two signals were needed. `SIGTTTOU` is sent when a background job attempts to write to the terminal; `SIGTTIN` is sent when a background job attempts to read from the terminal. Some mechanism was also needed to allow the user to suspend temporarily a job started in the foreground and then communicate with the shell to perhaps put the job into the background. A new signal was added to the terminal driver, `SIGTSTP`, usually emitted by Control-Z. It is sent to the job that is in the foreground on the terminal.

Since most jobs take no special action with the `SIGTSTP` signal, the default action is followed. The process is put to sleep and the `SIGCHLD` signal is sent to the parent of the process. This is usually the user's shell. With `cs` the user gets some interaction like:

```
% cc -O hello.c
^Z
Stopped
%
```

The word 'Stopped' here is confusing, especially to VMS users who think that the job has been killed. But the process hasn't stopped for ever, it has merely been suspended. It would be better if `cs` printed 'Suspended'.

When the shell gets the `SIGCHLD` signal,

Reusable C++ Components for Portable Applications

Tools.h++ - the portable foundation class library available for DOS, Windows 3.X, Windows/NT, OS/2, MAC, UNIX, and others...

An industry standard library which is a complete toolbox of over 100 C++ classes. It includes all the fundamental data structures and functions needed to do virtually any C++ programming task - includes template classes. All classes support persistence, and the library includes full internationalisation support and is multi-thread safe.

DBtools.h++ for portable database access

A true object-orientated approach for database access **DBtools.h++** provides developers with all the data structures in **Tools.h++** plus a powerful set of classes for database manipulation to provide a complete library of foundation classes for database applications.

DBtools.h++ objects are OLTP-capable, multithread-safe, with full access to database-specific features, and features runtime binding which provides simultaneous access to heterogeneous databases with native connectivity to Oracle, Microsoft SQL Server, Sybase, and ODBC.

All product names referenced herein are trademarks of their respective companies

Money.h++ - the portable library for representing decimal fractions EXACTLY!

With up to 96-bits (28 digit) precision **Money.h++** provides for the exact representation of decimal fractions with both fixed and floating point classes. Powerful error handling, rounding options, and formatted I/O are provided to give you total control; the power of BCD's, but faster & with more flexibility.

Meijin++ - the advanced mathematical toolkit

Meijin++ is a comprehensive C++ class library for virtually any numerical task from simple data structures to the modelling and simulation of complex systems.

Others libraries are available for GUI, Drawing, Financial, Mathematical, and Scientific Applications. **CALL US NOW WITH YOUR REQUIREMENT.**

One Development View

INTERSOLV's cross-platform data accessware is for developers building database-independent applications using ODBC. Our unique, thinly layered approach leverages productivity and insulates your application without blocking access to key DBMS functionality. With INTERSOLV, you code and maintain a single set of highly efficient source code regardless of the number of different data sources.

Many Deployment Options

Using INTERSOLV's drivers, you can link any ODBC-enabled software to your choice of over 30 different data stores. Even ODBC applications not built using INTERSOLV's developer kit are eligible. Most important, our ODBC drivers are fast and memory efficient—unlike other ODBC drivers that hamper performance. So, if you need to link Excel to dBase, Lotus 123 to SYBASE or Access to INFORMIX, check out INTERSOLV's ODBC drivers

INTERSOLV DataDirect - the standard in client/server data access:

INTERSOLV DataDirect Developers Toolkit allows you to build DBMS-independent, ODBC-compliant applications. **£500 per developer.**

INTERSOLV DataDirect ODBC Pack enables users to seamlessly access corporate data from any application that supports ODBC standards. **£350 for all drivers, £85 per driver.**

INTERSOLV DataDirect Multilink/VB increases the power and functionality of Visual Basic to boost development productivity and optimise system resources. **£300 per developer.**

INTERSOLV with ODBC is the Answer!

The Standard for Client/Server Data Access

INTER SOLV

 CIRCLE NO. 211

it notices that the job has been suspended, fiddles with the process group on the terminal so that it controls it, prints 'Stopped' and a prompt.

The user can now type a **bg** command to run the job in the background. This causes the shell to send a SIGCONT signal to the process group of the backgrounded job making it run again. The **fg** command does exactly the same thing, except that the shell will set the stored process group on the terminal to that of the **cc** command.

The use of signals for all these functions may seem to be overkill. They do provide a mechanism for processes to notice and deal with various start and stop situations. For example, visual editors like to catch the SIGCONT signal so that they can re-draw the screen when they are restarted.

Sessions

POSIX wanted to find some portable way to bridge between the way that process groups are used on different systems. We have seen that systems with job control manipulate process groups for a user to provide the job control facility. If you login to a system with no job control, then all your processes that you launch will be in a single process group. As usual, the POSIX committee sought some compromise and created the notion of a *session*.

A session is a collection of one or more process groups. A session is started by a new system call **setsid**. This provides a clean break from the old process group and the old session. For the call to be effective, the process calling it must not be a process group leader. If this is the case, then the **setsid** call makes the current process into the *session leader* controlling the session, creates a new process group using the current process id, and it removes the controlling terminal from the process.

POSIX doesn't define a portable way of acquiring a new controlling terminal. BSD systems have an **ioc1** call to achieve this, but I suspect other systems may need to close all references to the terminal and re-open it to set the controlling terminal.

What use is **setsid**? Well, there are several occasions where you might wish to start a new session. Consider an editor like Emacs. An Emacs user can open a window and start a shell running in it. The user has editor control over the data typed into that window. On a BSD system, the shell will be talking to a pseudo-terminal (I talked about pseudo-termi-

nals in February's EXE) that should be its controlling terminal. The editor will be talking to the master end of the pseudo-terminal.

Before sessions existed, setting this structure up correctly was very non-portable across systems, because the parent of the shell running in the window was the editor. Now it's only necessary to **fork** and call **setsid** to create a new free-standing session. As long as the various opens are done in the correct order, the child shell is presented with controlling terminal and process group behaviour that is indistinguishable from the situation that would have occurred had it been called by **init** to talk to a regular terminal.

Accelerate reporting with the #1 award-winning reporting tool.

New Crystal Reports Version 4.0

There's no better way...to create reports!

Design reports without coding! Do two-pass calculations, sort and subtotal in just one step, sort on groups, export reports to many file formats, distribute reports via integrated e-mail and much more!

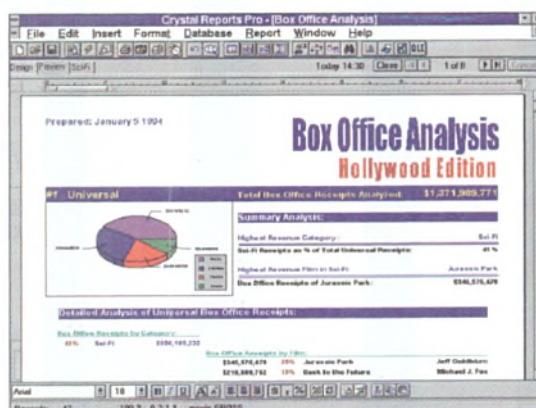

There's no better way...to integrate reports into applications

Crystal Reports' unique architecture consisting of a Report Engine DLL and open APIs make it the ultimate tool for fast, seamless report integration into database applications. That's why Microsoft, Borland, Sybase and over 50 other vendors bundle Crystal in their shrink-wrap programs.

There's no better time to buy the #1 reporting tool...now with hot NEW features in Crystal Reports 4.0

- Greater Report Engine Control
>80 calls (20 new)
80 VBX properties (40 new)
All new ODC
- Blob bitmap support (Paradox, xBASE)
- Report Distribution Expert collects DLLs, EXEs, and configuration files for report distribution.
- Integrated Graphing: 12 styles
- New Select Records Query Interface
- Tab Interface
- Best Fit
- Automatic Styles
- Grid Control Options
- Ruler
- Undo
- Title and Summary Pages
- Bar code fonts

- 2-10 times faster report processing with Smart Engine Technology
- Stored Procedure support
- Ability to sort data on the SQL server
- Drilldown analysis capability
- Crystal Reports Experts:

- Free Runtime
- And much, much more!

CIRCLE NO. 215

It's time to write of many things

After limiting himself to only one subject, this month

Francis Glassborow

decides to cover multiple topics in his article. Most of them deal with C issues.

Over the years this column has grown like Topsy. Originally it was a half page to complement the half page that Mike Banahan was writing on behalf of ECUG. After a year Mike found that he lacked the time to do justice to his column so I absorbed his space. A little later Will Watts moved on to another job and in the resulting hiatus I managed to grab another page. Cliff Saran as editor said he wanted single-topic articles. Not every topic justified the space but it takes little skill to pad text if necessary.

Now Will Watts is back pro tem. He is the kind of editor that likes to be in control and mould the work of contributors. I think that is an important editorial job so I welcome his input.

His first suggestion was that I take this back to being a column rather than a series of articles, but one with enough space to tackle several items each month. Both of us would welcome your feedback on this change. Immediate, specific response from readers is more useful than just reacting at renewal time.

Progress with C++ standardisation

As a result of the recent ISO round of voting, the Working Paper (WP) has become a Committee Draft (CD). In accordance with the ANSI X3J16 rules this goes out for public review, from mid-May till July 28.

A number of other countries are also carrying out formal or informal public reviews between early May and mid-July when there will be a formal vote on moving the CD forward to becoming a Draft International Standard (DIS). This level of vote is from National Bodies (NBs) based on the recommendation of their specialist committees. The UK's NB is the BSI and the relevant committee is IST5 guided by the C++ panel. Both the Netherlands and France voted against submitting the WP for registration as a CD. Presumably they will also vote against it becoming a DIS. My best guess is that there will be several other NBs voting 'no' and I will be surprised if the UK isn't among them. Some of you may be happy that the standardisation process seems to be so far along, others may be concerned. Either way, I don't think you should hold your breath as I think that we are in for quite a

few rounds of voting before we have an International Standard (IS).

In my view, the newer aspects of the language (templates, exception handling and namespaces) need more attention than just polishing and editorial fixes. These are all that is allowed after a nascent standard moves from a CD to a DIS.

The Standard C++ Library

There is also the question of the position of the *Standard C++ Library* in the eventual C++ Standard. At root, a standard library isn't a library in the normal sense. In C++'s case it is three things at once: support for the kernel language (such as provision for the operator `new()`), items that would benefit from direct language support (such things as complex numbers are candidates) and those items that support portable code by defining universal public and protected interfaces. Only the first of these is essential to C++ as a language. The others are excellent candidates for an international standard but not necessarily as part of the language. Those who want everything in one package should face the consequences - late delivery of a buggy product. We've all been down that route in our work as programmers.

C problems

My postbag and experiences with training in C++ show that there are many capable C programmers who know less about the language than they think they do. That is a dangerous state to be in - ignorance of your ignorance can be fatal. Test yourself on the following code snippets:

```
int fn(struct X* x);
struct X { int i; } ex;
main() {
    fn(&ex);
    return 0;
}
```

And
in FILE1:

```
char buffer[200];
```

in FILE2:

```
extern char *buffer;
void init() {
    int i=0;
    for(i=0; i<200; i++)
        buffer[i] = '\0';
}
```

The experts among you will quickly dismiss the two problems as trivial. For the rest, the first should not compile - if it does your

compiler is flawed. The second must compile and link but produces undefined behaviour. Don't even try it unless you are willing to restart your machine (or you are using a protected memory operating system such as Windows NT). I'll put the answers at the end so as to give you some time to think about them.

Smart pointers

Now, some programming meat. I will try to include some in each of my future columns. The subject of smart pointers is one that I am likely to return to because it is an important C++ idiom with special language support. This time out, I will keep to the fundamentals.

There are two special operators that handle dereferencing: '*' and '->'. The first of these is clearly a unary operator in this context, but what surprises many programmers is the discovery that the second is also treated as a unary operator. There are further surprises as well, but they are all necessary if the family of *smart pointer* idioms is to work. Consider:

```
ptrT -> something();
```

The compiler checks in the scope of the `ptrT` type for a definition of `operator->()`. If it finds one it looks at the return type. If this is a basic pointer to type (i.e. it evaluates to an address of an object), the compiler selects the member `something()` from that object (or returns a compile-time error if no such member exists). If it isn't a basic pointer, the compiler looks in the class of the new type for an `operator->()`. It applies this recursively until either the search fails or a basic pointer is found. Now:

```
class MyType;
//predeclares a class
class ptrMyType {
    MyType* mt;
public:
    ptrMyType() : mt(0) {}
    // default to null pointer
    ptrMyType(MyType* m) : mt(m) {}
    operator MyType* { return mt; }
    MyType* operator ->() { return mt; }
};
```

Now I can write:

```
ptrMyType anmt(new MyType);
anmt -> something();
```

I will need to do something about handling the potential memory leak that such code can generate but that is a step too far for this column.

The above class specification needs much more work before you can reuse it as a template class. For finished code we must consider such details as copy construction and assignment. However it does contain the core of the most basic of smart pointers. I leave you to consider if the type conversion operator `MyType*()` should be qualified as `explicit` in future (when that keyword is implemented by your compiler). Instead I want to focus on a major consequence of taking control of dereferencing pointers. We have encapsulated the functionality and so control it. Consider the problem of the null pointer. We can now provide debug versions of `ptrMyType` which detect null pointers and take whatever action we deem appropriate. In the simplest case we can have:

```
operator MyType*() {
    if (0==this) abort();
    return mt;
}
MyType* operator ->() {
    if (0==this) abort();
    return mt;
}
```

Of course these examples are too simple but it is the basic idea that matters. Just as we use access functions to retain control of our data we can use smart pointer classes to keep control of dereferencing.

A book

If the subject of smart pointers is new to you, or you can handle the rudiments but want to go further, I recommend that you put *Secrets of the C++ Masters* by Jeff Alger (ISBN 0 12 049940 1) on your reading list. Be careful because the title looks like one from a SAM series but the book is an *Academic Press Professional* publication. Despite the title and garish cover it is an excellent read. The author is occasionally flippant, in one place he's gratuitously rude about those serving on X3J16 without even adding that he was only joking (perhaps he wasn't). Such items should have been pulled by the technical reviewers.

Those C problems

The first snippet is very specifically a C problem because of C's special scope: the prototype scope. The `struct x` is first declared in the prototype scope of `fn()` and so has no validity outside that scope. So the subsequent definition of `struct x` is a new item unrelated to the previous one and, not as you might have thought, a completion of an incomplete declaration. Nit-picking? Yes, but if your compiler implementor cannot get such details right, where else have they got it wrong?

About the second snippet. In a value based language such as C, too many talk about the type of a value as well as the type of a variable. Addresses - the values stored in pointer variables - get talked about as pointers. This dooms successive generations of programmers to fall into this tarpit. The name of an array is not a pointer variable, it evaluates to an address (pointer *value*). As long as the compiler can see the context it will get it right, or report an error. But in this code, all the compiler can see in `FILE2` is what you have written - you say that `buffer` is a variable for storing `char` addresses. It will compile code to extract the address of a `char` from the address that the linker will provide. This address is not the `extern char buffer[];`

address of a pointer to `char` variable but the address of a `char`. `FILE2` must declare: Then the compiler can generate the correct assembler to evaluate the addresses of the elements of `buffer[]`.

If you do not understand this you have yet to complete your C apprenticeship.

Version 2.0

OEW for C++ Engaging to Warp

Boost the pace of your C++ development from impulse to warp speed with Innovative Software's OEW V2.0, The Object Engineering Workbench for C++. OEW V2.0 now more than ever before propels software development light years ahead of using conventional development tools. Complete "forward and reverse engineering" capabilities deliver dramatic increases in developer productivity and team communication throughout the life of the project.

OEW provides a road tested working solution for object-oriented analysis, design, implementation and documentation for C++ based applications.

OEW V2.0 completely supports all AT&T C++ 3.x standard C++ compilers and easily integrates popular class libraries. With just a simple click of a mouse you are expertly importing and exporting entire programs in and out of OEW.

If you are using ObjectStore™ or POET™, OEW will manage your entire database schema design. The advanced code generator and symbolic parser technology handle the C++ language extensions, container classes and types used by these OODBMS. Object Engineering and software re-use are a breeze with OEW, because you benefit from the total support throughout your engineering cycle.

OEW V2.0 is available for Windows™ 3.x, Windows NT™ 3.x and OS/2™ 2.x. All versions include a context-sensitive online help system, a comprehensive tutorial and various example projects based on commercial class libraries.

If you are building software using the C++ programming language, explore the new frontier of software development. Join the thousands of productive OEW users around the world. Call **Now** for more details.

Announcing CodeServer™

Discover Client/Server Power with xBASE file compatibility from C, C++ and Basic.

With **FREE** Client/Server Distribution

With our new CodeServer, your data is safe, your software is reliable and you save \$\$ with royalty-free distribution.

Completely Scalable Technology

Move from single-user, to multi-user, to Client/Server, all using the same CodeBase API—without code rewrites.

Multi-User xBASE Compatible

You can still access your data directly from dBASE, FoxPro and Clipper.

Special Offer:

Now for a limited time only, with every order of **CodeServer™** you get:

- a **FREE** CodeBase™ Technology product for the language of your choice
- a **FREE** copy of CodeControls™ visual design software,
- a **FREE** copy of CodeReporter™ visual report writer software,
- and a **FREE** CodeReporter™ end-user distribution license.

Improve Reliability and Safety

Using CodeServer only one computer physically changes your data. So even when a client crashes, the database is safe and others can continue working.

Improve Network Performance

Reduced network traffic means improved network performance.

xBASE File Formats

Choose between dBASE, FoxPro, or Clipper file formats for your data.

Logging

Now you'll know who changed what, and when.

Incremental Backups

Make daily backups of all the changes made that day.

Query Optimizer: 1000 times faster

Automatically uses available index information to return query results instantly.

FREE Report Writer Distribution

Now give your users the ability to easily create their own ad-hoc reports by distributing our report writer with your applications, ROYALTY-FREE!

Developing in
Windows,
there's no
salvation
without a
debugger.
Colin Smith
takes the
Bounds
Checker
penguin on a
bug hunt.

In leaps and bounds

Debugging is an art shrouded in mystery. There are no hard and fast rules, only techniques. I knew one programmer who coded in assembler (for DOS may I add) but refused to use a debugger of any kind. Instead he resorted to the use of strategically placed 'beeps' (with key presses) which allowed him to listen to his programs! The code he produced was as stable as anyone else's. As long as the technique enables you to find the bugs in a reasonable amount of time, it's a valid one. Once you enter the world of Windows, it isn't long before you have to head for the sanctuary of a debugger.

With the claim that all professional programmers will be redundant in the next century (*EXE* December '94 - *Soapbox*) because users will be doing their own applications, bugs may just be one of the things that keep us all in a job. Bug hunting is the most frustrating part of programming, and often the thing that puts DIY people off - thankfully! If we can get rid of bugs better than the DIY end-user, then maybe there will be some hope for us, plus it will stop them complaining that *commercial* apps are bug-ridden.

Pick up a penguin

Bounds Checker for Windows is hailed as the debugging tool that you cannot or should not do without. It actually consists of several tools rolled into one:

- a heap checker,
- a debug kernel (so no need to use N2D.BAT to switch to the debug kernel),

- a message and event logging utility (spy),
- an API debugger (checks API parameters and return values),
- a post-mortem tool (for GPFs).

At the end of the day these tools are meant to find obscure bugs (the most frustrating) that most ordinary debuggers are incapable of finding. Just some of the things Bounds Checker can detect are: invalid memory accesses (e.g. through NULL pointers), heap and data corruption, memory and resource leakage, hardware faults and API parameter errors.

To be able to perform all these magical tasks, Bounds Checker takes control via a 200K VxD - sorry Warp people. As the checking Bounds Checker performs is very Windows version specific, it comes in four Windows varieties: Win32s, Windows NT, Windows 3.1, and Windows 95 (pre-release).

When an *error* is detected (or you purposely suspend the program), Bounds Checker pops up and lets you examine a variety of information, through its MDI interface - see Figure 1.

Duty bound

Bounds Checker requires no changes to the source code, and no linking of code or macros into the executable - all you have to do is compile with debug information. If you haven't got the application's source code, or if your 'natural language' is assembler then you can miss this step.

To 'Bounds Check' an application you first load Bounds Checker, then select the Load Application option which asks for the .EXE you wish to debug. Bounds Checker then tries to work out which DLLs and VBXs (by scanning the .EXE's resources) that this application will want to use, i.e. the implicitly loaded DLLs, and presents them in a list. If your application dynamically loads DLLs, i.e. via a `LoadLibrary` call, then you get the opportunity to add them to the list, so that their symbol information will get loaded as well. Bounds Checker then loads the application's symbol information for the .EXE and .DLLs (if they have any) and begins execution of the application.

There is also an External Load feature that lets you tell Bounds Checker to activate itself when a particular .EXE file is about to be executed. You have to use this option if the application you want to be tested is started by another program which you do not want to check, because you can only 'Bounds Check' one application at a time.

When the application is terminated, a .LOG report gets created. This report contains information on how much stack was used, the total amount of local and global memory that was allocated, as well as a record of the API failures etc. that occurred, and possible memory leaks. So, no longer do you have to guess how big to make your application's stack - Bounds Checker helps you to make a more informed decision as to what to set the `STACKSIZE` statement in your .DEF file.

Other Databases.

POET 3.0

**Finally. The Object Database That Delivers More Platforms,
More Features and More Performance Than Any Other Database.**

It's easier when you choose the right tool for the job. Pick POET 3.0, the third generation of the world's best-selling object database. POET 3.0 is tightly integrated with C++, accelerating development and simplifying software maintenance.

More Platforms

POET 3.0 transparently networks PCs, Macs and workstations. Scale from a laptop to a workgroup to an enterprise server effortlessly. And only POET 3.0 supports all these operating systems:

- Windows, Windows for Workgroups, Windows NT and Windows 95
- Macintosh OS • Novell NetWare
- OS/2 • UNIX • NextStep

More Features

POET 3.0 includes POET Developer, an integrated, GUI-based workbench. Plus a toolset of system services, so you can focus on building your application.

Integrate with applications like Word and Excel using OLE 2.0. Create SQL-like queries with POET's OQL.

POET 3.0 is Distributed in the UK by:

Silicon River Limited.

106-108 Powis Street,

London

SE18 6LU.

Telephone: 0181-317-7777 Fax: 0181-316-7778

And with the ODBC driver, you can combine POET databases into existing environments.

More Performance

POET 3.0 offers the power of object databases and the reliability of relational systems. You get the POET Administrator, an industrial strength database manager that includes user authorization, online backup and transaction rollback.

POET 3.0's object server architecture maximizes performance and eliminates processor dependencies. And POET 3.0's unique navigation abilities speed client responsiveness.

There's no better object database tool than POET 3.0. For a limited time, get the POET 3.0 Personal Edition for just £149*. And cut the toughest object database problem down to size in no time.

Tally ho

A good brush won't make you any better at painting unless you know how to use it properly. This equally applies to debugging tools. So it's pleasing to see that Nu-Mega has taken the trouble to provide a practical tutorial that introduces the basic concepts of the Bounds Checker tool.

There is quite a large performance hit if you have all the default options on. So one of the first things you should do is disable all the options, and then go away and think carefully about which options should be turned on. This will save you a lot of time and disk space (see below).

Bounds Checker recognises API calls from the following modules: COMMDLG, GDI, KERNEL, KEYBOARD, OLECLI, OLESVR, SHELL, TOOLHELP, USER and VER. From this set you can configure which API calls **not** to log or validate, and thus stop Bounds Checker popping up on API calls that you know are ok, or that don't tell you anything. If you use other APIs e.g. WING, WINSOCK etc. then you are stumped, because there is no way to extend the list.

Bounds Checker (optionally) treats an error returned from an API call as a prospective error; e.g. the value of `HFILE_ERROR` returned by an `OpenFile` call is considered an error. The premise is that you may have forgotten to handle these error conditions, so it treats it as an error as an extra safety precaution - it can't tell whether you were clever enough to put in the code to handle these exceptions! To prevent this behaviour, you can turn off the option to check API return values, or less drastically tell Bounds Checker to ignore the check on that line if it gets to it again, and continue onto the next line.

The API parameter/return value checking feature relies on the dodgy API calls being made in the first place. If your testing procedures do not exhaustively test every part of your code, then Bounds Checker never gets a chance to perform its checks on them - so bugs could easily still slip through the net.

Version 2.2 of Bounds Checker now supports debugging for Visual Basic Custom Controls (VBXs). If you have already taken the carrot (or stick) of moving to OCXs then this will only be useful if you have to maintain some legacy applications. However, VBXs may be given a new lease of life by Borland's Delphi.

One area that may cause a little inconvenience is the configuration scheme adopted. You can't set up the options on the basis of each .EXE that you intend to 'Bounds Check' - they apply globally. Most options are in a single .INI file, while the list of APIs *not* to

Bounds Checker
can have an
important role to
play during the
alpha and beta
stages of a
development, when
dedicated testers
finally get the
opportunity to wreak
havoc on the application

parameter check is in another file. So if you have to regularly Bounds Check different .EXEs with different options, you could quickly get in a muddle.

I spy

One of the most comprehensive parts of Bounds Checker is its ability to log a wide range of events. These include:

- API calls (including symbolic parameters i.e. with reference to your program's symbols)
- API return values
- Toolhelp/Kernel notifications
- Windows messages
- Hook callbacks
- Visual Basic API calls
- Visual Basic API return values
- Visual Basic CTL messages

When the program you are debugging is suspended (e.g. because Bounds Checker caught a potential error, or you suspended the application on purpose), the last 1024 events that have occurred are listed in the MDI 'Event' window. For a longer history of events you have to resort to recording the events to a .TRC trace file; for viewing by the separate TVIEW program. If you log all events then your .TRC file gets huge quite quickly, your application can run painfully slowly as a result, and you have loads of events to manage in the .TRC file. To help with performance there is an option to cache the events that are written to the trace file. This causes a slight problem if you want to load up the .TRC file via the TVIEW program (while the program is suspended) for more detail. The last few events won't be there, because they're still in the cache!

There are two opportunities to manage events. You can choose whether the event

is logged when it occurs, or you can log every event and then use the TView application to filter out the events that you are not interested in.

I want my debugger back!

When using Bounds Checker, it's quite natural to want to use a traditional symbolic debugger alongside it. The implication in the manual is that to be able to debug a program when Bounds Checker is in operation, you need to use Nu-Mega's Soft-ICE for Windows. This is further emphasised by the 'special' menu option which invokes Soft-ICE for Windows.

However, there is a way to use the CodeView debugger in tandem with Bounds Checker. This fiddle relies entirely on the External Load feature, and is certainly not the way this option was originally intended to be used. You load Bounds Checker, tell it the name of your .EXE via the External Load option, and then Bounds Checker merrily waits until it begins execution. Now you can fire up CodeView, pick your .EXE, set some breakpoints, and then off you go.

The situation is very different if you use the debugger built into the Microsoft Visual C++ IDE. Any breakpoints you set before launching the .EXE are just skipped past as if they weren't there. The breakpoints only take effect if they were set after the program started execution. I think this is a case of 'The Battle of the Debuggers'.

How it works

Bounds Checker uses several techniques to find your bugs. One involves writing a specific bit pattern after each block of allocated

Once you enter the world of Windows, it isn't long before you have to head for the sanctuary of a debugger

memory. It then periodically checks to see if the pattern has been altered, indicating that some code has written beyond the end of that heap block. This won't take you to the exact line of code that caused the corruption, but it will be pretty near.

One of the things Bounds Checker does is to set hundreds of breakpoints, at points in the code where there are Windows API calls. This enables it to check if the API arguments are correct before the call is made to Windows, and check the return mode value. If you look at the System Stack window of Figure 1, you can see that the function `ISVALIDLOCALHANDLE` was called by

the module `BCHKWFPV` (the parameter checking module of Bounds Checker) and this determined that the `hPal` parameter to `SelectPalette` was invalid.

Whenever there is an error caused by a piece of code, Bounds Checker walks back through the stack to look for a function for which it has source e.g. if a GPF was caused when `memcpy` was called, then you are taken to the line where `memcpy` was called, and not to the actual assembler instruction in `memcpy` that caused the exception.

Another technique is used to track your GDI/USER resources. Bounds Checker is aware of Windows API pairings, e.g. `LoadBitmap`, `DeleteObject`, so it maintains a table of handles, and watches for the handle to be deallocated e.g. a call to `DeleteObject` with the handle as a parameter. There are some situations in Windows when handles may get freed by a different route, so this check may incorrectly report an error.

A view to a bug

TView is a separate utility that allows you to view the trace files created by Bounds Checker. It has various view filtering options for different classes of events e.g. filter out API calls, API return values, hook calls, etc. that make the task of finding events that are of interest as simple as possible. If you have most of Bounds Checker's event options enabled then the .TRC file can easily grow to 20 MB in size. When your .TRC file gets into the megabyte region TView can sometimes be painfully slow at scrolling through it - which can't be helped I suppose due to the sheer amount of information recorded. Intelligent use of Bounds Checker's logging filters will help to avoid this situation. As the .TRC file produced by Bounds Checker is a binary file, you are reliant on TView to view it. There is an export option that allows you to save the events to an ASCII file. However, the export option does not maintain a hierarchical (tree-like) view of the events, plus you lose the ability to examine calls' parameters, e.g. which string was passed.

The filtering options include one called 'Noise Reduction'. When enabled, this option removes the API calls to `GetMessage`, `TranslateAccelerator`, `TranslateMessage`, and `DispatchMessage`, default Window procedures (e.g. `DefWindowProc`), and other usually non-significant events. This is a handy way to make the captured events much more readable. However, TView has a tendency to crash if you are working with megabyte sized .TRC files and you make heavy use of the filtering options.

You may have seen a little shareware utility called APISpy which performs the

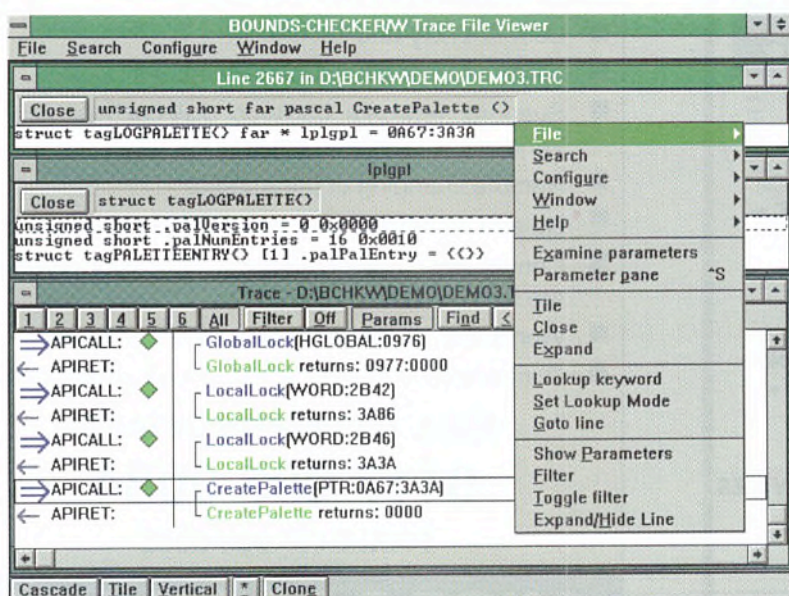

Figure 2 - Viewing a .TRC file with TView

simple task of spying on Windows API calls and logging them as they occur. If APISpy came across a `ShowWindow` call, it would use the `HWND` parameter to find out the title of the window, and the `int` parameter to find out which window visibility flag was used. APISpy would log the call something like,

```
ShowWindow(
    "Microsoft Word - BOUND.DOC",
    SW_SHOW ),
```

while Bounds Checker would log the call something like `ShowWindow(HWND:7B94, WORD:0005)`. To find out the same information that APISpy provides with Bounds Checker, you would have to resort to using TView's 'lookup keyword' feature, which just launches the Windows API Help file that came with your compiler and plunks you at the topic that describes the `ShowWindow` API function - you are expected to find out what the 5 corresponds to. You may even have to resort to searching through `WINDOWS.H`!

With API calls that include a string parameter, e.g. `DrawText`, you don't get to see the string unless you go through a laborious process. First you make sure that the `Draw-`

One more Bound

Bounds Checker for Windows v2.5 has just been released. The new features added since v2.2 (which this article covered) are:

- validation of 16-bit applications in Windows 95 (beta 3),
- parameter and return code validation for dynamically loaded MFC DLLs,
- trace support for MFC (2.50) calls in TView.

Support for Bounds Checking 16-bit windows apps under Windows 95 now gives developers a chance to move to Windows 95 as their development environment, instead of being tied to Windows 3.1 to use Bounds Checker.

Essentially the last new feature removes the hassle of using the separate MFC Tracer program (which comes with Visual C++) to trace MFC calls/messages. Bounds Checker does not support static linking of the MFC code - only dynamic linking is supported. This shouldn't prove to much of a problem as this is the more common way of using MFC.

Comparing Bounds Checker with Spy++ (in Visual C++ 2.x), it becomes clear that more polishing of the user interface is required for Bounds Checker. It maintains its technical superiority, but could just do with looking nicer!

Another observation: With calls such as `ReadComm` and `LoadString`, you supply a pointer to a buffer (to be filled) as one of the parameters. Well, when TView records the event, i.e. the fact that the API function has been called, it records what was in the buffer *before* the call is completed, so you can't see the effect on the buffer.

Also Matt Petriek said to EXE at the Software Developers' Show that he considers the 32-bit version of Bounds Checker 'superior' to its 16-bit counterpart. The amount of problems detected is increased and some errors are brought up automatically, reducing the number of mouse clicks necessary.

MICROCOSM LTD

1 Eastfield Road, Westbury-on-Trym, Bristol BS9 4AD

Announcing a Major New Upgrade of CommLib

Greenleaf CommLib 5.0

Over 350 public functions and macros, providing powerful tools for all aspects of asynchronous communications programming for Microsoft Windows 3.1 and MS-DOS.

Now we provide even more of the power and features you've asked for!

Some features of CommLib 5.0:

- ☐ Level 2 device-independent C functions for these drivers: MS Windows, Greenleaf Standard, Fast, Smart, Digiboard, Smart Arnet, Smart Star Gate, Sparkle, BIOS, Extended BIOS, Polled, MODEM Assist, FOSSIL
- ☐ NEW! Support for WIN-32 API and 32 bit DOS extenders
- ☐ NEW! Support for Windows NT
- ☐ XMODEM, YMODEM, ZMODEM, Kermit, ASCII, many options
- ☐ NEW! Support for Compuserve B+
- ☐ Unlimited number of ports for ISA, EISA, MCA
- ☐ Modem controls, keyboard, screen, handshaking and much more!
- ☐ Supports all popular C and C++ compilers

What's included:

- ☐ Free source code
- ☐ All memory models supplied
- ☐ Examples that compile and run included for every function
- ☐ Professional documentation
- ☐ Free technical support and access to our BBS

Greenleaf CommLib 5.0

Only £259 excluding delivery and VAT

No royalties

90-day money back guarantee

☎ Telephone today for complete information, demonstration, or details of how to order.

Painless Data Compression and Archiving

Introducing Greenleaf ArchiveLib

Experience the power to compress and store data from anywhere, to anywhere in your C/C++ applications. Until now your development choices for data compression and archiving in C or C++ applications (and other languages too!) were severely limited. Professionals – don't be stymied any longer!

ArchiveLib includes a fast, efficient compression engine and architecture for addition of other compression methods. You control source and destination (file, memory, port, etc.) of all data. Complete control over format of archives.

Many extras for Windows programmers.

ArchiveLib Major Features:

- ☐ 100% C++ class library plus C interface
- ☐ Supports Microsoft Windows 3.1, MS-DOS, and Watcom 32-bit extended DOS
- ☐ Portable data compression is fast and efficient
- ☐ Platform and language independence
- ☐ Coded for Win32 – smooth path to 32-bit Windows

- ☐ Extensible through plug-in compression classes
- ☐ Five compression levels – auto or manual selection
- ☐ Versatile archiving – files, memory objects
- ☐ File information automatically included in archive
- ☐ Release and debug library versions included
- ☐ Tagged objects flag allocation or pointer errors
- ☐ Extensive Windows support includes compression/archiving progress meters and message options
- ☐ Wildcard expander class is also useful for general purpose application
- ☐ 25 classes – over 100 functions in C and C++

What's included

- ☐ Free source code
- ☐ All memory models supplied
- ☐ Examples that compile and run included for every function
- ☐ Professional documentation
- ☐ Free technical support and access to our BBS

Greenleaf ArchiveLib

Only £229 excluding delivery and VAT

0566 86037

FAX 0566 86147

BBS 0566 86925

Citadel Software Ltd
Coombe, Trewen, Launceston,
Cornwall PL15 8QF

Text function is the one highlighted in the log, then you select the Examine Parameters option, which creates an MDI window that

contains the parameters' types, names, and values. String parameters merely show the pointer's value - to see the actual string you have to click on the parameter which creates another MDI window containing the string. If, as I do, you like the way CodeView presents variables in the watch window i.e. keeps things together, and expands structures with a new level of indentation, then this will be increasingly annoying to you.

Bounds Checker makes a poor attempt at interpreting the parameters of API calls, and messages. You may get the occasional glimpse of LMEM/GMEM_XXXX, and WS_XXXX flags, but that's about it.

Don't throw away your copy of Spy or Winsight - you may still need it. Spy and Winsight are quick and convenient to use because you just point to the window you want to spy on - and you only get the messages for that window. There is no similar way to filter out the messages for a particular window in Bounds Checker - you have to look for messages with the same HWND value. To its credit, it does indicate undocumented messages. So if you suspect that a certain application is using an

undocumented message to perform a wonderful feat - Bounds Checker could confirm this for you. The reason why undocumented messages are given special attention may be due to Matt Petriek who was heavily involved in the book *Undocumented Windows* and Bounds Checker. He is also the author of *Windows Internals* which shows how Windows works!

Do your alphas betas Cs

Bounds Checker can have an important role to play during the alpha and beta stages of a development, when dedicated testers finally get the opportunity to wreak havoc on the application. It is usually difficult for testers to describe to developers how to repeat a crash or bug, especially when the bug is a sporadic one. With Bounds Checker, when an API error, or a memory overwrite etc. occurs, the tester can leave a comment in the log describing what they did leading up to the problem. All the developer needs is the .LOG and .TRC files, plus any data files that were being used at the time, to try and diagnose the problem.

Bounds Checker is simple enough for a non-developer to use. There is even a special 'silent-mode' option, that stops Bounds Checker from popping up when an 'error' is detected (it just logs the error), which helps prevent testers being frightened.

If you currently use Microsoft Test to perform a test suite on your application, then you will be pleased to hear that you can automate Bounds Checkers functions and options via your test scripts. And just think, you can go one stage better than Microsoft did during the beta of Windows 3.1 which just came with Dr Watson as the post-mortem debugger!

A magic wand?

If you think Bounds Checker will wave a magic wand and find all your bugs for you automatically, then you will be disappointed. If, on the other hand, you want to look in detail at what your application (or your competitor) is doing, have a good testing procedure and want to increase the likelihood of finding bugs or improve the information returned by your testers, then Bounds Checker may be just for you. ■

Colin Smith is a software engineer at Trans-Send International Ltd, developers of Trans-Send CommsCentre. He can be reached via email at colin@transend.demon.co.uk or by telephone on 0181 236 0117.

Bounds Checker is available from System Science (0171 833 1022). For one environment (Windows 16-bit, NT, Windows 95 or Win32s), it costs £195. With Soft-Ice the price is £379.

You sell one and they duplicate it.

Software piracy and casual copiers are enjoying the fruits of your labour. After all the work you have put in developing your application your software is being copied and you're losing out.

It is estimated that 49% of all applications are pirated so you can see a dramatic increase in your income by protecting your software. No wonder then that serious software developers are turning to BL Computer Security Ltd. to ensure that nobody takes them for a ride.

BL designs and manufactures hardware security devices (dongles) to protect your intellectual copyright.

Offering protection to small and large companies alike, BL ensures that developers such as yourself are always protected.

We are constantly supporting new platforms such as NT, OS/2, Novell and Sco Unix for your present and future needs.

There are a number of products available, ranging from **£6.00 each**. Please call us on 0181-343 0734 and one of our staff will introduce you to a product that will suit your needs. Thereafter, you may, if you wish, order a developer pack on a one month free trial basis or alternatively arrange for a personal demonstration at your office.

Telephone: (44) 0181 343 0734 Fax: (44) 0181 346 2672 Email: adeneli@cix.compulink.co.uk

The popularity and reputation of your applications among end users are greatly enhanced by the quality of your help files and manuals. If they look good and are easy to navigate, your customers will use them. And you'll get fewer tech support queries. Yet it's always tempting after months of slaving away getting your application right, simply to "throw in some help files" and cobble together a manual.

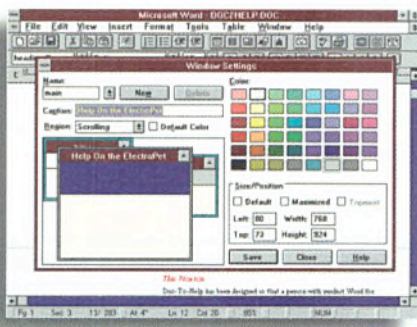

That's why you need Doc-To-Help by Wextech Systems.

Doc-To-Help is a single source documentation and help authoring system for Windows that's fast, easy and intuitive.

From start to finish Doc-To-Help provides tools to speed and facilitate every aspect of document and Help authoring.

Doc-To-Help's true single-source approach allows you to create, maintain and format document and help files simultaneously. As an extension of Microsoft Word for Windows, Doc-To-Help makes a familiar environment even more friendly and intuitive.

Doc-To-Help automatically creates basic hypertext structures for your Help by intelligently mapping your "flat" document's information structures to their hypertext equivalents. Doc-To-Help can derive and implement a robust Help hierarchy, Help topics and subtopics, browse sequences, pop-up definitions and a full keyword search system, all based on how you've organised your printed document.

Help author designs the Help file's appearance from the Help Window Editor

Introducing

Quicture

Enhanced Graphics Handling for Microsoft Word for Windows

If you do lots of graphics work in Word for Windows, Quicture will give you extra speed while greatly sparing your hard disk resources. MS Word stores pictures in the document itself during WYSIWYG editing, which, apart from slowing things down during scrolling and saving, makes your document much much bigger. Quicture overcomes these problems by storing MS Word's pictures in compressed files, replacing them with descriptive,

Smooth Scaling

Why Compromise on Image Quality?

When you reduce the size of bitmapped graphics images, the result is almost always loss of definition, caused by "aliasing". This is particularly damaging when your image contains text, which becomes illegible. Smooth Scaling enables you to reduce any graphics image by up to 90% with virtually no loss of clarity. Keep your graphics images accurate and attractive.

DOC TO HELP

There's simply no better way to create Windows online Help and no easier way to write a manual

- Woody Leonhard, *Windows 3.1 Programming for Mere Mortals*

Doc-To-Help lets you override, extend or build automatically-created help features - you retain complete control.

Attention to detail? Doc-To-Help automatically handles layout attributes: headers and footers; tables; crop marks; sideheads; even and odd pages; gutters; page numbering; and margin notes. Powerful utilities speed the creation of your document's Table of Contents, Glossary of Terms and Index. Your document and Help can include graphics in many formats, including 256-colour bitmaps.

You can easily control all aspects of your Help file's appearance - including window sizes, placement and colours - with Doc-To-Help's graphical Help Window Editor. And multiple hotspots are a cinch.

Cutting edge tools. The Doc-To-Help API allows integration of an author's own WordBasic macros to extend and customize the Help conversion and compiling processes. Context-sensitive Help is fully supported: a remapping utility allows developers to retain their own map numbers; Visual Basic programmers can create context-sensitive Help using a drag-and-drop interface; sample code for C, Visual Basic, Word, Excel and Access applications is provided.

No matter what kind of documentation you have to write, Doc-To-Help's intelligent tools are with you at every step to make your documents and Help look better, work better and take less time to write and maintain.

Doc-To-Help, Quicture and Smooth Scaling are all available from QBS Software. Call us today for further information.

Give Your Bugs The Bird!

Get The Combined Power of A Heap Checker, Spy Utility, Debug Kernel, API Debugger And GPF Tool, All In A Single Package.

Need the perfect bug finding tool? Nu-Mega has it! — in Windows, DOS, WindowsNT, WIN32s even Windows 95. It's called BOUNDS-CHECKER™. Many say it's the most versatile and powerful automatic bug finding tool money can buy. Our customers love it because it saves them huge amounts of time and does "clean-up" better than anything out there.

Where Do Bugs Come from?

Today's bugs are just as likely to come from improperly interfacing with the operating system or third party components as with your programming language. That's why we've expanded BOUNDS-CHECKER into a single comprehensive tool that points it's long bug hunting finger at the types of problems you are most likely to encounter.

Stop Problems like:

■ API Parameter Errors ■ Memory And Resource Leakage ■ Data And Heap Corruption ■ API Compliance Errors ■ Processor Faults ■ C/C++ Pointer Errors ■ API Return Value Errors ■ VBX Interface errors and more!

Find Out Why They Happen

Your work is not always done when the bug is found. In fact, 50% of the job is finding out what caused the bug. There's great news though — BOUNDS-CHECKER works as your partner in helping you diagnose the problem. Along with giving you the description of the bug, BOUNDS-CHECKER reveals the source line that most likely caused the bug! For more difficult problems, you can access a variety of windows and inspectors that show you the state-of-the-program at the instant the bug was found! And for "killer bugs", BOUNDS-CHECKER shows you the history of events that led up to the problem! What's more, with BOUNDS-CHECKER, you can go back in time and observe the series of Windows mes-

sages, APIs and other events that preceded the bug. This is the power you've been waiting for — now turn week-long debug sessions into a few minutes work!

New In BOUNDS-CHECKER!

VBX and Windows 95 support— BOUNDS-CHECKER now validates the VBX custom control interface and logs VBX

expand, level-by-level! You can also view API parameters and even bring up the source line associated with an event. Besides helping you see programs from the inside, (even on executables with no debug information), TView is an excellent tool for tracking down some of the toughest Windows problems.

The Perfect Q/A Tool

If your job includes making sure your company's programs are as solid as possible, you need the power of BOUNDS-CHECKER. Many of the bugs that BOUNDS-CHECKER finds will be invisible during test cases, but this tool has eyes! You cannot possibly test every permutation on every conceivable system configuration —but, by using BOUNDS-CHECKER, you can flush-out the hidden bugs and greatly improve your quality.

Don't Doubt It, Do It!

Next time, show your bugs who's boss...**Give'em the bird!** 

events as part of its trace history. Whether your program is written in VB, C/C++ or any other language, you can get a handle on some of the weirdest bugs you are likely to hit.

TView™ - Cool Event Viewer!

As your program runs, BOUNDS-CHECKER transparently logs messages, API calls, hooks, callbacks, VBX calls and many other events in a trace file. TView, BOUNDS-CHECKER's event viewer graphically organizes and filters events so that you can see a high-level view of your program's run-time activity. When you want to see more detail, just click on events of interest to

Order A Trio And Save A Bundle!

Choose any two BOUNDS-CHECKER products and get the third FREE!

Creating Windows DLLs

using only Basic Source Code

Have you ever wanted to create a DLL but only know Basic? **Robert Stimpson** found a way to develop DLLs without having to resort to C.

If I could program in C, the challenge of creating DLLs for Visual Basic would not arise! It's not that I don't like C or that I cannot understand it; it is simply historical fact - my path to programming started with fluids modelling on a mainframe with FORTRAN. QuickBasic and MASM converted me to the PC, and here I am, currently with Visual Basic, with just a slight twinge of jealousy over the additional tools at the C++ programmer's fingertips.

Visual Basic (VB) gives the programmer a first-class development and debugging environment for Windows programs. It allows the creation of 'compiled' code in .EXE format (albeit P-Code which requires the VBRUN-xxx.DLL to execute it), but poses one major problem - you cannot create function or utility libraries in the true tradition of the DLL principle. Previously, the only way to create a DLL which could be called from VB was to program in C, typically Visual C++, and use the Windows SDK to create a DLL to serve the VB program. This is not a practical option for most VB programmers.

Basic languages for DLLs

My first approach was to examine the MASM route to the DLL, but time was not in great abundance, and so I needed to discover what, if anything, existed to write DLLs in Basic. Initial calls to QBS and Grey Matter revealed GFA Basic for Windows as an option from the latter, but not from QBS, who did not stock it routinely because they did not consider it an adequately supported product in the UK. With this caution at the back of my mind, the GFA Basic compiler and interpreter arrived from Grey Matter and I then sat down to create my first DLL using Basic.

More recently I discovered Visual DLL from Simply Solutions on CompuServe, having decided to trawl through a FIND using only DLL as the key. (You can find Visual DLL under GO SIMSOL). Having downloaded and tried the demonstration model available there, an order was placed direct with Simply Solutions (California) and 48 hours later Visual DLL arrived in its slim ring binder.

Taken together, the two products solve all of the programming challenges that exist for me, using VB to its limits. Each has different benefits and drawbacks, GFA being the bigger challenge of the two.

GFA Basic provides a Windows development environment which allows you to create a truly compiled Windows executable or DLL with no P-code in sight. Visual DLL (not to be confused with a shareware product called VBDLL) runs in parallel with an existing VB installation and provides the facilities required to create a VB executable and convert it into a DLL which can be called from any other application possessing a DLL caller interface.

Simply stunning solutions...

Visual DLL provides a development environment in which you define the routines to be placed inside your DLL. Each routine is named and you also define the names and types of each parameter you want to pass to the DLL routines. Selecting EDIT from the Visual DLL menu or using the EDIT push-button on the button bar first creates a new project sub-directory below the Visual DLL

For real programmers

I wanted to be able to provide my VB code with some fundamental resources to allow it to match the versatility of Microsoft's DOS Basic compilers - BC7 and QuickBasic - such as DOS and BIOS interrupt calls, and other low-level facilities and also take advantage of the DLL facility which *real* programmers using C under MS Windows take for granted. I also needed to be able to create a rigorously tested and unmodifiable suite of analysis routines and make them available to colleagues who could use them either in other VB applications or as embedded functions in Lotus 123 or Excel.

To share a set of library functions you have developed in VB with colleagues who may have use for them usually requires the distribution of *naked* source code. This may allow accidental corruption or inadvertent reassignment of variable values to occur, removing any benefit the original concept of shared code might have had.

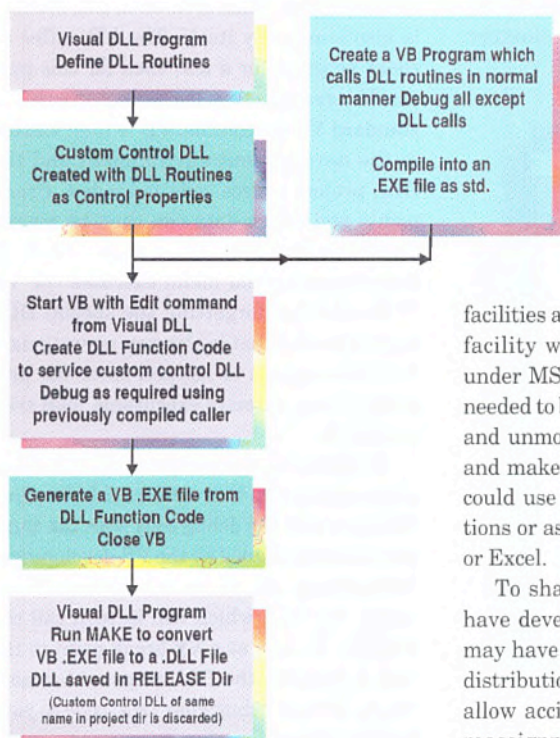

Figure 1 -
DLL creation process for Visual DLL

directory, and then starts up VB to allow you to create the source code for the DLL routines as if the routines were properties of a control, placed on a form.

After writing and testing the code in VB, you then select **MAKE EXE** in the normal manner and exit VB. Returning to Visual DLL running in the background, you then select **MAKE** from the project menu, and Visual DLL does its magic, taking the VB .EXE and creating a DLL from it.

Simply Solutions has been very clever in designing how Visual DLL works (see Figure 1). The **MAKE DLL** command creates an executable DLL code *shell* around the VB.EXE code so that DLL users or callers call the Visual DLL *wrapper* functions. These pass their arguments to the enclosed VB routines which execute as internal Microsoft P-coded routines in the normal manner, calling any other required DLLs including the **VBRUNxxx.DLL**. Since the VB compiled P-code and its operation is unchanged, it is guaranteed to run flawlessly.

All of the routines to be incorporated within a new DLL (**Functions** or **Subs** as declared by the user or caller), are all created as **Sub** in the Visual DLL Custom Control. Where a return value is to be provided (as with a **Function** call) the last parameter of the DLL **Sub** declaration will appear as **ReturnValue AS ...**. When running, the Visual DLL wrapper catches the returned value from the VB executable and returns the required parameter to the caller.

Returning VB strings from a DLL

Returning a string is a special case. Since the DLL created will be a true DLL, complete with

local data and VB data segment (as if it was a VB.EXE application in its own right) simply defining and returning a VB string will fail. A string created in the DLL will use the VB string space applicable to the DLL, so to return the string you must pass the address of the DLL string handle back to the caller as a **pc** and **courier**, although the caller will declare and use the return parameter as a string.

The **MAKE** process in Visual DLL also generates header files for both Visual Basic and C callers of the new DLL.

The invisible VB program

What Visual DLL actually does when the DLL is called, is to load the DLL into memory, extract the VB executable *invisibly* to the local **TEMP** directory and execute it as an invisible task. The caller only sees the DLL interface, and all of this clever interfacing to VB is confined to the background.

The development stage of creating the DLL also warrants special mention - after defining the routines you want to see within the DLL, selecting **EDIT** from the Visual DLL front-end creates on-the-fly a unique Custom Control DLL (rather than a **VBX**) which contains definitions of the routines you have specified. Each of the DLL routines has become a property of the custom control on the form. Double-clicking the mouse on the custom control brings up the code window for the custom control, allowing you to edit the code in each routine. Figure 2 shows Visual DLL's front-end.

This development stage custom control DLL has the same name as the final DLL you want your VB code to ultimately reside within, although it resides within the project directory

which was created by Visual DLL before VB was fired up.

The final *encapsulating* DLL containing the VB executable code is always located in a directory called **RELEASE** which is below the project directory.

The development stage DLL thus has interfaces to call VB development level code within VB, exactly like a standard custom control **.VBX** or **.DLL** loaded in the normal manner. The **RELEASE** directory version contains the final VB-coded executable in its DLL wrapper.

Simply Solutions has addressed this possible area of confusion both in the manual, which is clear and concise, and also in the header files and documentation produced along with the creation of the Visual DLL for each DLL project.

One drawback to this process is that the library routines created are not currently fully re-entrant (this will be fixed in an imminent upgrade release), so recursive function fans must create function-within-a-function interfaces so that the recursion occurs entirely internally within the DLL. This appears to be an effect of using VB in this way, since the main caller application and the DLL are separate VB applications communicating via a DLL interface.

Debugging DLLs

Debugging the DLLs created in this manner is also simplicity itself. The VB caller or client program (or a test shell for this purpose) is created, compiled and set to run as a standard VB executable. VB is then started in the development environment and the DLL project source code is loaded. Break points and debug data can then be set up. Once this has been done, selecting **RUN** from the command menu executes the VB DLL code (not forgetting the special DLL custom control that is also now operational). Nothing appears to happen since the program has no directly executable load-triggered code.

Now start up the compiled VB *caller* program. As soon as this calls a DLL function, Windows sees the debug copy with the same name already loaded by the VB development environment and creates the instance interface to the DLL which will in turn call the VB code. As soon as a VB break point in the code is reached, the DLL stops mid-stream for you to then debug your DLL code to your heart's content.

Two words of caution here though. Executing the VB *client* with the DLL code

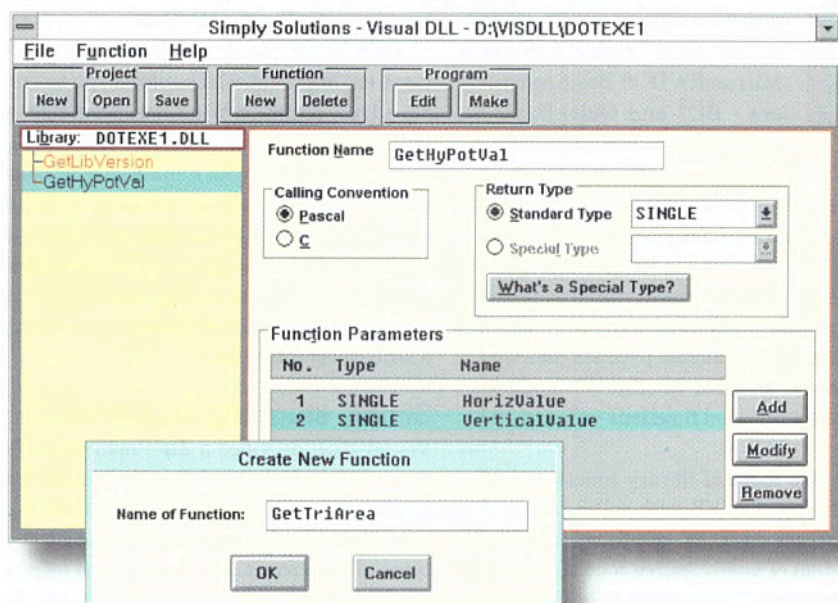

Figure 2 - Visual DLL interface

' Example DLL Code for GFA-BASIC Windows Compiler
'
' By R W Stimpson 08.05.95 for .EXE Magazine
'
=====
' compiler directives for DLL follow:
' name library
$library EXEDEMLL
' create a link library and target directory
$LNK EXE C:\GFAWIN\DEMO\EXEDEMLL.DLL
' add description (used if DLL is loaded by PROGMAN)
$DESCR "VB DEMO DLLFOR .EXE (c)1995 R W Stimpson "
' declare start of a procedure (equiv. to Sub or
' Function in VB - this is internal GFA name)
PROCEDURE GetCurrentDrive()
' specify the exported name and DLL ordinal number
$export EXEDemCurDrive, 1
' turn error trapping on
TRY
' call DOS int 21 Fn 19h Get Current Drive
~(INTR(&H21,_AX = &H1900) )
' get lower byte of _AX reg
IDriveID& = BYTE(_AX)
' return 2-byte integer value (& in GFA) to caller
RETVAL IDriveID&
' turn off error trapping (or go here on error)
CATCH
' return error value
RETVAL -1
RETURN

```

Insert	Run	Variable	Config	debug	rcS	Compile
0	0	C:\GFAWIN\DEMO\EXEDEMLL.GFW			18:57:02	1

Figure 3 - GFA Basic development environment.

GFA Basic code to create a simple DLL and VB caller declaration

loaded but not running under VB's development environment will cause a GP Fault (understandable really, considering the DLL has its code currently residing in a glorified text editor). Secondly, VB keeps track within its executables of where it has called external DLL routines, and displays error messages if you try to call a function again before the debugging process has been completed and the call has returned to the VB executable.

Extending Visual Basic

One minor drawback of this simple but brilliantly effective technique is that while Visual DLL provides an effective way to distribute your library code in this manner, it does not extend the capabilities of VB as a language. This is where GFA Basic comes into its own.

GFA Basic has origins going back to the Atari - and unfortunately it appears to have been developed for

Windows in isolation from the integrated development environments used by Microsoft in QuickBasic 4.5 and Basic 7 PDS for

the PC. GFA's development environment is very similar to PowerBasic's DOS development environment (albeit a poor relation), but with a quirky Basic dialect, which makes variables double precision reals by default, is unable to use single precision reals, and has other irritating limitations (all variables are global unless you explicitly and individually say otherwise) which makes it appear to be the illegitimate offspring of an unfortunate liaison between GWBasic and Visual/QuickBasic combining some of the weaker points of both.

Having said all this to make sure you are aware of the challenges to be faced, persisting with GFA is worth the extra hassle for a seasoned VB or QB programmer - the end result is a blisteringly fast and compact DLL. Combine this with a huge selection (approaching 800) of internal GFA functions, including the ability to bit shift, pack and unpack bits, bytes, words and dwords using GFA native functions and your programming repertoire is considerably enhanced. The GFA Basic language also allows painless calls to interrupt 21H functions. The error trapping interface within GFA Basic is far more user friendly than the Microsoft ON ERROR... offer to date - simply enclosing a section of code in a routine with TRY...CATCH will end the routine at

CATCH if no error occurs, or transfer processing to after CATCH if an error is detected (see Figure 3).

GFA or Visual DLL?

GFA's strength is in the production of truly compiled DLLs which execute exceptionally fast and are as good as the ones generated by Visual C++. GFA bundles a custom version of the OptASM linker to produce the compact .EXEs and .DLLs for Windows after the GFA compiler has been let loose on your GFA source code (don't try VB code - there are major syntactic differences!).

The primary use for GFA Basic as I see it will be to produce a DLL of functions which once declared within a .BAS module will give VB programs global access to the DLL, allowing VB to be extended to the enhancements that GFA offers, without the hassle of re-conquering GFA every time I need to use it.

Visual DLL has the ability to work with VB 3.0 and the forthcoming version 4.0 UK. During the coding of one routine, I inadvertently selected C Calling Convention. Upon loading VB3 the warning text comment appeared in the code window 'Decl is only supported in VB4' - so now you know!

GFA Basic is a unique and powerful contender within the Windows field, but you must be aware of the quirky interface, poor documentation and minimal support in the UK. (All technical support queries are referred to the German HQ of GFA since the reseller does not use the product. It is probably best to get support directly with Germany using CompuServe - GO GFASOFT) If you are prepared to embark on a steep learning curve to produce a tight, fast DLL using a syntax and language which is 80% MS Basic, 15% GFA and 5% C, then have no fear.

To conclude, the only drawbacks I have found with Visual DLL are that you cannot set the ordinal number of the DLL functions created, and you are limited to the facilities of VB to create your code. GFA has a generally richer language set, produces a pure executable of exceptional speed, but has an abysmal development interface and crude debugging facility. If GFA were to gain the interface VB possesses it would be totally unbeatable. However, it hasn't, so these two secondary products are destined to reside in complimentary arenas, supporting VB as the primary Windows development host.

Bob Stimpson is involved with the application of VB to the solution of Engineering Design Software problems across PC-Unix platforms to provide bespoke CAD/CAM design packages. He can be reached on CompuServe id: 100537,235 or at home on 01260 298499.

That's how much money was lost in Europe through improper or illegal use of software last year. Your money.

If you are in the business of software development, then the emphasis is on you to protect your own investment by securing your software products.

Since 1985, Data Encryption Systems have been the UK's leading software protection specialists. They have created a range of state of the art security solutions for software developers and IT managers alike.

Whilst retaining an impenetrable level of security the DESkey is easy to implement, reliable, transparent in operation and very flexible.

Our unrivalled range covers all standard operating platforms including DOS, Windows, Macintosh, UNIX and environments from stand alone systems to LAN's and mainframes.

DESkeys are available in a variety of

low-cost high-speed models which include the standard DK12, the DK37 PCMCIA, the DK8 Mac DESkey and the immensely sophisticated and versatile DK2 and DK96.

And as with all Data Encryption Systems products, DESkeys are easy to use.

With DESlock and DESnet you can implement DESkeys in a matter of seconds – by just typing a simple DOS command or selecting a Windows icon.

What's more, Data Encryption Systems can give you total technical support including bespoke product development and, where appropriate, access to our highly experienced team of designers.

Now, thanks to Data Encryption Systems, there is a genuine alternative to lost software sales.

They're worth looking into now – to save your share of the £3,100,000,000!

Book review

Efficient C/C++ Programming reviewed by **Bob Swart**

This book provides C and C++ programmers with several real-world examples on how to optimise their code. Unfortunately for C++ programmers, only one of the eight chapters is

about C++ efficiency, the others are only on C.

Efficient C/C++ programming optimisations are presented at the algorithmic level, which is always more effective than plain syntax code optimisations (an assembly version of bubble sort is still slower than a plain C/C++ version of quick-sort). I'm very happy that the author never fears to use Turbo Profiler to show the effects of his optimisations or to find the bottle-necks in his code. Heller feels that you cannot guess where the bottle-neck is; you must actually search for it and check to be on the safe side!

Sorting, hashing and data compression are among the several real-world programming techniques and algorithms covered here. *Efficient C/C++ Programming* also introduces a new, so-called 'quantum' file access method which allows efficient access to variable length

records. Each subject is covered in a separate chapter, and each chapter consists of two parts: first, the introduction to the problem and detailed analysis with a fast solution, and second, the source code itself. Often, however, the source code consumes more pages than the text itself, which gives the feeling that the book is more a source code listing than a textbook with algorithms (I counted 229 pages with code listings out of a total of 411 pages!) I'd have preferred a kind of mixed approach where interesting parts of the listings are interwoven with the text. Now, more than half of the book will remain unread, as it is just plain code that can be found on the accompanying code disk. Another weak point of the book is the rather short index of three pages. Even the little amount of actual text deserves more than three pages especially when the authors own 'quantum' stuff gets a whopping 21 references.

Now, please don't think that this is a *bad* book. On the contrary, I rather liked it, as it's one of the first efficiency books to truly deal with real-world problems and their solutions. The author shows his experience while treating the different problems and examining possible solutions and their efficiency. The use of Turbo Profiler shows that Heller really knows

that only the final cold facts count. I wish that every C/C++ programmer (or at least those who work with me) had read the book and so made good technical decisions prior to building a new application. So no unpleasant efficiency surprises will await when the application is ready but slow as an old dog.

If you're not afraid of the unnecessary code listings in the book and if you know that C/C++ efficiency is an issue for you, then this book should be on your desk. If you don't care about efficiency, or think that any performance problem can be solved by adding a bigger CPU or more RAM, then I still invite you to read this book and see if you think the same afterwards. I think not. This book is an indispensable cookbook for the art of real-world efficient C/C++ programs.

Verdict: Recommended

Title:	<i>Efficient C/C++ Programming</i>
Author:	Steve Heller
Publisher:	AP Professional
ISBN:	0-12-339095-8
Price:	£29.95
Pages:	411 (softcover) with code disk

Well-appointed 9 Bedroom House. Des Res. Elegantly decorated and comprehensively furnished with a wide variety of vital information. Ideally suited to software developers.

Enquiries to: <http://www.exe.co.uk>
No appointment necessary
 Managing Agents: EXE - The Software Developers Magazine.

Room 1: About Us - and You. Where you find out how to get around the house. This is our home page, and we'd like you to make it yours too. There'll always be a comfy chair for you in the About Us room.

Room 2: The Magazine - where all the techies like to hang out. You'll find lots of programming tips, code and a large reference library telling you where to find particular topics and features in previous issues of EXE.

Room 3: News Online - bang up-to-date information on the latest products, tools and what's happening in the industry.

Room 4: Ctrl Break - like Ctrl Break in EXE except much bigger. Competitions, cartoons, crossword, exclusive offers, funnies and all manner of amusing nonsense.

Room 5: IT Vacancies - jobs, jobs, jobs - permanent and contract. Set your requirements on various criteria and see what's there for you. Updated daily.

Room 6: Diary - helps you forward plan for the main industry events and training dates for programming and other IT courses around the country.

Room 7: Speak Out - where you can get involved in various discussion groups on the technical issues and burning industry issues of the day. Get things off your chest and share gossip.

Room 8: Prize Draw - every month your name will be put forward for a fab high-value prize. Provided you've visited us, off course.

Room 9: Subscribe NOW - this room is for all those unfortunate others who are missing out on the top magazine for software developers.

BRITE

BRINGING PEOPLE & INFORMATION TOGETHER

Brite Voice Systems is one of the world's leading suppliers of Voice Processing systems. Operating on a truly international basis, they design, build and manage voice processing systems that bring people and technology together. The key areas in which Brite concentrate are Voice Messaging, Audiotex, CTI (Computer Telephony Integration) and IVR (Interactive Voice Response). Brite's European Technical Centre is based in South Manchester and continued business success has created the immediate need for the following staff:

SOFTWARE ENGINEERS

£17K-£24K + Benefits

At Brite, Software Engineers work across the full development life cycle from technical specification through to implementation, covering all stages in between. Various technologies are in use at Brite and you should have at least two years 'C' development experience with either UNIX, OS/2 or DOS. In addition, any exposure to Voice Processing, Communications or Telecomms applications would be beneficial.

Ref: BVS/SE8.

SOFTWARE TEAM LEADERS & PRODUCT INTEGRATORS

£20K-£26K + Benefits

Software Team Leaders act as the Design Authority for products, being responsible for scheduling work, planning, setting deadlines and providing post implementation support, whilst still being hands on enough to cut code when needed. 'C' and UNIX technical skills are essential. Product Integrators act as the facilitator of change for products, with reference to new methods, for example, managing the implementation of a common GUI front end across the product range. 'C', UNIX and OS/2 skills essential.

Ref: BVS/STLP1.

SALES SUPPORT & SITE SUPPORT ENGINEERS

£18K-£26K + Benefits

In association with the Account Manager, the Sales Support Consultant is responsible for all pre-sales activities; presentations, scoping, demonstrations, prototypes etc. For this high profile role some Voice Processing experience is essential. The Site Support Engineer is responsible, world-wide, for post-sales customer support/systems implementation. UNIX systems administration skills and the mobility to work anywhere in the world (for up to 3 months at a time) are pre-requisites.

Ref: BVS/SSE.

PROJECT MANAGER

£24K-£30K + Benefits

The Project Manager is the prime interface with the customer, responsible for all aspects of the business including integrating hardware and software, managing finances, resources and suppliers. Customer satisfaction and project profitability will be key measures for success.

Ref: BVS/PM.

GRADUATE SOFTWARE ENGINEERS

£11.5K-£13.5K + Benefits

Investing in the future, Brite are looking to recruit a number of recent/fresh graduates. A Computer Science (or similar) degree is essential, a placement year and 'C', UNIX or OS/2 technical exposure is preferable.

Ref: BVS/GSE.

All these positions are based at Brite's European Technical Centre in South Manchester.

Brite Voice Systems is committed to providing quality information applications which exceed the expectations of their customers and add value to their business. Crucial to this is their skilled and dedicated workforce. If you would like to be part of this team, then send your CV to David Voice at the address below, quoting the appropriate reference and your current salary. If you would like to find out more then call either David Voice (evenings/weekends 01925 267828) or Shaun Plant (evenings/weekends 01298 23039).

Rullion Computer Personnel Limited, Permanent Division, Trafalgar House, 110 Manchester Road, Altrincham, Cheshire WA14 1NU. Tel: 0161 941 5335. Fax: 0161 929 5676. email - davidv@rullion.demon.co.uk

Specialists in Software Development Staff Recruitment

OOD/OOP, C, C++, VISUAL C++

ALL LEVELS

As the market for Object Oriented skills gathers pace we have a number of clients designing systems in diverse application areas including: **Multi-media, DTP, Telephony, LANs, Electronic publishing, On-line information Feeds, Finance and Banking** in both a UNIX and DOS environment.

Positions available vary from traditional Programmer/Software Engineer and Analyst/Programmers to Designers/Senior Software Engineers in the overall strategic direction for end-user organisations.

£17-£35K + benefits

REF: SC/01/EXE

WINDOWS OR X-WINDOWS/BANKING

ALL LEVELS

Three city clients require windows skills at any level. Other relevant skills are SQL server, Transact, SQL, UNIX, VMS or MS-DOS, C, C++, Open Client (DB and Net library), MFC, Open interface and APT. Exposure to analysis, developing user interfaces and rapid development techniques. Full training in Middle Office/Production and Front Office Systems including: Financial and Management Accounting, Treasury, Equity, Fixed Income and Derivatives.

£20-£25K + Banking benefits

REF: SC/02/EXE

C AND C++ PROGRAMMERS

ANALYST PROGRAMMERS

Excellent opportunities exist for bright graduates with one year + experience. Personal background requires a solid understanding of the project life cycle and a commitment to high quality coding. You will be trained in all aspects of Investment Banking, relational databases, 4GLs and Object Oriented Design. A good opportunity for a second career move.

£17-£25K + Banking benefits

REF: SC/03/EXE

CAMBRIDGE - MANY, MANY EXCITING OPPORTUNITIES

A wide variety of specialist, leading edge IT companies in areas as diverse as: **ROBOTICS, TELECOMMUNICATIONS, MULTI-MEDIA, GIS, BUSINESS MODELLING, FINANCIAL/TREASURY, EMBEDDED SYSTEMS and SOFTWARE/GUI RESEARCH/ MANUFACTURING** require high calibre software development staff at junior and senior levels.

Technical skills required include: **C, C++, VISUAL C++, VISUAL BASIC, X-WINDOWS/MOTIF, GUI's, NT, TCP/IP/X25/X4000, PROGRESS, SAP, Relational Databases, INTERNET CONNECTIONS and ATM** (Communications not ATM machines).

REF: 04/EXE

INGRES/ORACLE/SYBASE/GUPTA/OOD AND OOP

ALL LEVELS

Additional experience of: **SQL, Forms, C and C++** required. We currently have client companies including Management Consultancies, Systems Houses, Systems Vendors, Bank and Finance clients looking for candidates with: Relational Database design, Database tuning, Systems Administration, DBAs, Pre/Post Sales and solid programming knowledge and expertise. Please call to discuss your particular requirements.

£18-£40K + benefits

REF: SC/05/EXE

C/C++/VISUAL BASIC - UNIX OR MS-DOS

DEVELOPERS

Software House and End Users in Finance, Banking, Manufacturing, Commercial, Scientific and Government application environments require excellent C skills. Both Windows development skills W/3, SDK, NT, X-Windows and Visual Basic or strong C, C++ solid operating systems and good application knowledge are again much in demand. Software development experience is the key, and being able to deliver high performance, high quality, well specified software in competitive time scales. Opportunities vary from small to large software companies involved in expert systems, GUIs, Image Processing, GIS, EIS, Communications, Networking and Object Oriented Databases. Graduates through to senior software engineers/team leaders are required. Please call to discuss.

£14-£35K + Benefits

REF: SC/06/EXE

UNIX/VMS/MS WINDOWS/NT MFC/C/C++

ALL LEVELS

A degree in computer or natural science, two years solid C/C++ programming experience and a sound understanding of UNIX, VMS or MS-DOS are required to work on large scale programs with user interaction. You will need an intelligent problem solving approach to work and be a quick learner to programmer software in an X-Windows, Windows SDK or NT environment, port software to different systems and liaise with customers to drive through product improvements. Excellent career opportunities for the right candidates.

£16-£28K

Life in the Fast Lane

Surrey to 28,000

Excellent opportunity to use your Electronic System development or your embedded software skills to move your career into pole position. You will be developing "state of the art" electronics and software used in motor racing world-wide. You need either a good grounding in Electronics (Digital/Analogue) or embedded software (MS-DOS, C, Assembler) and have the wish to work in a fast moving positive environment. Contact: Adrian Wagstaff Quoting Ref: AW2604

Windows NT Drivers

Surrey/Berks borders to 30,000

Leaders in the development of innovative communications software seek a number of senior Engineers to develop their next generation software. You need to have Windows NT driver experience with C and C++. Preferably you need exposure to TCP/IP or Unix.

Contact: Adrian Wagstaff Quoting Ref: AW2603

1st or 2.1

(Multimedia, Video, Graphics)

UK Wide to 25K

You've just finished your degree and are well pleased with your grade. You've put a lot of work into your project/work placement and are now looking for a challenging development role in multi-media, video or graphics applications. I have these roles available for you immediately. You won't find a better range of opportunities available to you... anywhere. Give me a call.

Contact: Mike Jenkins Quoting Ref: MJ2606

Multimedia - Advanced Graphics

Oxford, Cambridge & London to 28K

These three companies are in the top four of Multimedia/Interactive /CD ROM developers. The massive growth in their respective markets means that they are searching for good experienced Software Engineers. The two development platforms are PCs and MACs requiring experience of either C/C++ and SDK or C and MAC tools. These positions obviously require a high degree of low and high level graphics development so either previous multimedia or graphics experience would be an advantage.

Contact: Simon Drew Quoting Ref: SD2600

Surf the Internet

Cambridge to 18K

Specialising in internet access products this rapidly expanding company offers a stable, informal and challenging development environment. They are recruiting for a Windows based developer with experience of Visual C++, Visual Basic and an interest in the Internet to design overall code structure using OO techniques. In addition to new development work you will be involved in porting existing products to new platforms ie Windows 95 and NT. Additional skills of use include TCP/IP, Informix, HTTP, CGI.

Contact: Simon Drew Quoting Ref: SD2601

For more information please call the appropriate Consultant on 01442 231691 days or 01908 222909 eves/wkends quoting the relevant ref no. Alternatively send your CV to:

Executive Recruitment Services

Boundary Way, Hemel Hempstead Herts HP2 7RX or fax CV to 01442 230063.

E Mail/Client Server GUI Gurus

Herts to 33K

This small, yet rapidly expanding, software company is embarking on the development of an advanced Windows-based mail enabled client server product. They have vacancies for 4 developers with 18 months+ experience of Windows development using either Visual C++, C++/SDK or Visual Basic on either Windows 3.x, Windows 95 or NT server. Additional experience of Access, SQL Server, modem based comms, ISDN, MAPI or the Internet would be useful. You will have direct responsibility for the design and implementation of individual system components.

Contact: Simon Drew Quoting Ref: SD2602

Virtual Window Drivers

Berks/London to 35K

Two clients with a common requirement for development staff to contribute significantly to next generation products. One develops advanced datacomms products and the other a suite of video editing software and hardware. In both cases a knowledge of C++ and WINDOWS/NT/95 or VxD is essential. All positions are senior roles and offer design authority.

Contact: Mike Jenkins Quoting Ref: MJ2605

THE DEVELOPERS REGISTER

Not on our New register yet? From April 1995 ASH associates started a New register for dedicated software developers who seek a career path driven by technology rather than management.

This is proving to be very successful with many excellent engineers having registered, finding or have already started with New employers.

We are now extending this option to engineers looking for their first move into contracting, we would like to hear from engineers from all areas of Technology who want to make this move Now or in the Future and we still seek those seeking a new permanent position.

NEW THIS MONTH

Exciting New Permanent Positions for UNIX and C Software Design Engineers based in Europe. You can expect a High Technology development environment working for the European Space Agency. this combined with High rewards. Speaking a foreign language is unnecessary with English widely spoken and essential for these positions.

For these and many other opportunities

Call James Hunt or Ron Cook

TEL (01425) 475480, FAX (01425) 480807 or write,
ASH associates, First Floor, 39-41 High Street
Ringwood, Hants BH24 1UF

MULTIMEDIA DEVELOPERS

SIMIS Limited produces top quality simulation and entertainment software for PCs and all popular emerging formats, which are brought to the public through some of the best publishers in the world. We are now expanding our UK development organisation with a Multimedia group to develop exciting new edutainment products.

Team Leader

You should be a self-starter with exceptional project management, man management and organisational skills with a first class track record in Multimedia product development. You will be an inspiration for those that work for you and an excellent communicator.

PC / MAC Programmers

These exciting new multimedia developments require dynamic young software engineers with a minimum of 3 years experience developing C under either MS Windows or on the Apple Macintosh. Experience of hypermedia, graphics or animation would be useful, but not essential.

Graphics Artists

Ideally you will have worked in a multimedia environment, in the areas of design and layout or preparation of 2D and 3D animations, photographs and video sequences.

All of the above positions are at our Headquarters in leafy Godalming, Surrey. Our work environment is second to none with top of the range equipment, superb offices and flexible working hours. All of the jobs are offered with competitive salaries, Profit Related Bonus Scheme, Health Care and Pension contributions.

Carolyn Reed, Simis Ltd, Simis House, 90 Meadow, Godalming, Surrey GU7 3HY

SOFTWARE ENGINEERS

Simis Medical Imaging is a small software house specialising in X-ray viewing systems and information systems for hospital radiology departments. We currently have vacancies for one Software Engineer and one Senior Software Engineer to join our Development Team. It is essential that you are an excellent 'C' programmer and have experience in some of the following:

C++ or other Object Oriented Language
Windows (Workgroups or NT)/UNIX
GUI's preferably Windows SDK or Motif
Microsoft SQL Server/Oracle
Visual Basic

In addition to the technical background, candidates will be graduates with at least 18 months experience (for the senior position at least 3 years) and must be well organised and able to show initiative.

Carole Davies, Simis Medical Imaging Ltd, Headley House, Headley Road, Grayshott, Hants, GU26 6TU Facsimile 01428 606091

Our client, a highly successful consultancy and product development group specialising in the financial sector has seen rapid growth in recent years. As a result, five development consultants are required to assist in new development and existing product migration. Applicants should have at least eighteen months Borland Pascal and SQL experience - excellent communication skills are also necessary. Successful candidates can not only expect a highly competitive salary package, but will be trained to use a Borland's Delphi client/server product.		This international settlements house established in 1970 is now developing its next generation of software and is searching for two highly skilled developers with excellent 'C'/C++ programming skills under UNIX with experience of Oracle and/or Powerbuilder. You will need to have a strong academic background, with excellent interpersonal skills and enjoy working as part of a highly motivated team. This is an ideal opportunity to work with the latest technologies in a technically challenging environment.		Europe's leading CD-ROM publishing company is seeking to recruit Windows development and testing staff at all levels of experience. They are building teams now to work on a number of new titles to be released into Europe later this year. Ideally, you will have worked in a multimedia environment developing software under either MS-Windows or on the Apple Macintosh. Any experience of writing or using graphics software, sound or animation would be useful, but is not essential.

JOB 3D GRAPHICS/MULTIMEDIA		JOB 'C'/UNIX		JOB ORACLE DEVELOPERS	
LOCATION	SALARY	LOCATION	SALARY	LOCATION	SALARY
Herts	To £16K	Home Counties	£18-£32K	Berks	To £30,000
This is an exceptional opportunity to work for one of the leading international players in the multimedia field. They are now expanding their product range of multimedia enabling technology. As part of this expansion they are searching for a junior Software Engineer with 3D Graphics, 'C' and/or C++ programming skills under MS-Windows. Any experience of UNIX would be advantageous. Don't miss this opportunity to work at the leading edge of graphics and multimedia development. Call us now!		High calibre Software Engineers are required by our client, a leader in Open Systems Technology. Suitable candidates will have at least two years 'C' programming experience in a UNIX environment. Knowledge of UNIX operating system development (kernel, utilities), assembler, level programming or compiler writing, although not essential, will be highly desirable. Working in a small, dynamic team, you will be involved in the development of new products and the support of existing products by investigating problems and creating solutions.		This international provider of telecommunications services is growing at a tremendous rate and is looking for several Oracle Developers. Suitable applicants will have at least eighteen months experience of developing Oracle based systems, backed up by strong inter-personal skills. Any knowledge of Oracle Case, Forms 4, Reports 2, PL/SQL, Pro*C or Oracle Financials will be advantageous, although training is available. Successful candidates will be developing UNIX based Oracle financial and purchasing applications through all stages of the project life cycle.

DISCOUNT BOOKS

THE BOOK PAGE

One for Delphi Newbies, One for Visual C++ Old Hands

Heavy Metal Visual C++ Programming

by Steve Holzner

600 pages

Normal Price: £37.99

☆ Price to You: £28.50 ☆

Your guide to using Visual C++ the way it was meant to be used, putting it's raw strength to work and picking up where beginner books leave off. If you're serious about your code and want to harness the full power of Visual C++, this book will take you as far as you can go. Learn how to bend the rules to your advantage, get into the guts of a program and rearrange a program's internals to your liking. For intermediate to advanced programmers.

Delphi Programming for Dummies

by Neil Rubenking

400 pages

Normal Price: £18.99

☆ Price to You: £14.25 ☆

The title is no reflection on EXE's opinion on our readers! However, a nuts and bolts book for a brand new product and a boon for inexperienced programmers and, perhaps, those who have no background in Pascal. This results-oriented book jumps right into creating working programs by collecting and connecting Delphi's powerful components. Neil Rubenking, technical editor of PC Magazine, also gives you ten common mistakes to avoid, almost ten of the most useful built-in Delphi functions and ten API functions useful with Delphi. Loads of sample code. For programming newbies.

COMPETITION: WIN #1 BEST SELLER "DESCENT"

From the minds that created Microsoft Flight Simulator™ and Ultima I™ & II™ comes the mind-twisting action game Descent, with over 30 levels of high speed arcade-style action. Descent is set deep in the mines of the moon where an unknown alien race has taken over the out posts of the Post Terrain Mineral Corporation.

Players encounter death-defying mine shafts and menacing robots as they set out to destroy each command centre and get out alive.

To win a copy of this #1 best selling game send a post card to the usual address marked "Descent". We will make the draw on the 31st July.

INTERNET: THE CYBERIAN CONNECTION DISCOUNTED VIDEO

Purple Training, in association with London's Cyberia cafe, have launched Internet: The Cyberian Connection, the first ever video explaining how to get the best from using the Internet. The video offers step-by-step advice to Internet novices, telling you what the Internet is, how to get connected, what's available and

how to get at it, how to join a discussion group, and how to send mail to any of the 30 million people using the Internet at the moment. The video normally costs £16.99 + VAT & shipping but is available to EXE Subscribers for just £14.99 + VAT & shipping. Contact Purple Training on 0181 742 0607 to place your order. You must quote EXE to get the discount.

FREE PHAR LAP EMBEDDED TOOLSUITE!

You may recall that in the April issue we reviewed Phar Lap's Embedded ToolSuite. We have one copy of it to give away. To win, answer the question "How many printed manuals are provided with ToolSuite?" (the answer is on page 17 of the April issue). Send your post cards to the usual address. The first correct entry to be drawn on July 31st will win.

LINUX CD

We have one CD ROM left over from the EXE Show. We were giving these away with new two year subscriptions and they were hugely popular. The set of four disks include complete Linux archives, complete GNU archive, Kernel sources up to 1.2.1, complete on-line documentation, DOOM (the game) for LINUX, Commercial demos and much, much more. To win this very last copy in our possession send in a postcard to the usual address to reach us by the end of July. Please mark your cards "Linux".

The Subscribers Club aims to bring you a selection of special offers every month. Please remember to quote your subscriber number when you order goods.

For further information on any of the offers featured above contact EXE on 0171 287 5000, or contact the supplier directly when a number is given

WORST WORLD WIDE WEB

... a little knowledge (of HTML) is a dangerous thing

Iambic software

<http://www.iambic.com/iambic>
...with Newton Tip of the Month and Catchy Couplet Poetry contest.

Business on the move

<http://193.131.77.142/botm>
a range of top-ranking 'hotles' (sic) are pleased to offer you 'the smallest portable in the world' - a computer diskette. Presumably that makes a notebook and pen 'the smallest information storage and retrieval system in the world'.

The Brothers Karamazov

gopher://gopher.vt.edu:10010/02/72/1
The Brothers Karamazov by Fyodor Mikhailovich Dostoevsky in electronic text.

Do you...

- turn your eyeballs to jelly
- give up, ignore the rainforests and print the whole thing out on paper anyway?

Control Freak Geek

Information Week reports that the 'Registration Wizard' in the Microsoft's Windows 95Beta collected information from your computer and all other connected computers... then sent the information back to Microsoft!

1984 in '95? Well, we've all heard stories of the email messages that errant MS employees receive from Mr Gates himself. If the 'Registration Wizard' implications are to be taken to their logical conclusion then it would seem that not even the smallest of garage programmers will be safe as Bill makes efforts to keep tabs on dodgy code worldwide.

Sweet Revenge?

The following was found by a Ctrl Break spy on a company notice board. Presumably the perpetrator had become fed up with being pestered for free advice and tech support by the newly en-Netted.

Tip of the Month: Many people don't realise that modems 'clog up' with constant use, especially if you have been downloading a lot of GIFs, TIFs and JPGs. The following simple procedure, carried out two or three times a week, will keep your modem running sweetly. Start your terminal program (e.g. Telix or Odyssey), and type ATDT999. The results will amaze.

Brian and Betty

All of these are from Lasermoon. Send your entries to the address above.

The All-New Adventures of Verity

We have heard little of Microsoft employee Melinda French since her marriage last year to Bill Gates. Presumably she is safely installed in the Gates' Xanadu-like underground palace, with its computer controlled doors and myriad of other gadgets. But Verity is concerned...

Dear Bill

Tuesday

The shower went wrong this morning, so I called out a programmer.

It was my fault. I rebooted the bidet, owing to how it wouldn't flush, but was stuck on a modal dialog saying Wasn't that nice! Ok/Cancel and thought I would freshen up while I waited for it to finish its login sequence. So I stepped into the cubicle and waved my hand over the hyper faucet, and of course I got a stream of boiling mango-scented gel down my right boob, *Yipe!*, because, as Bill explained later in his email, the network DDE link with the boiler had gone down when I rebooted the butt-washer.

Then I got mad, which was kind of silly, because this sort of thing must happen to other people most days, and I pressed the emergency reboot button for the whole bathroom, which of course you mustn't do while the bidet is rebooting in case it picks up a stray interrupt and goes into its emergency back up routine. Which it did and it did.

I wouldn't have minded so much except of course I couldn't wash it off in the shower because the shower was still spurting molten mango goo, and I wasn't really in a fit state to call out the 24 hour programmer over the vidlink. So in the end I emailed him priority Urgent. It took him ages to get here, because of course you need LoveNest

security clearance level to get through all the doors to our *en suite* bathroom and he had to literally hack his way in, so it was 4pm before I got to fix myself up and have a blueberry waffle.

I do wish that Bill were here, instead of an evangelising mission persuading the Native Australian Aborigines to use NT for boomerang design. He is such a practical man to have about the house.

Wednesday

And it's my birthday! Sadly, Bill couldn't make it back from Down Under owing to how he had to fly to Rio to get them to use Windows 95 in all their snowmobiles. But he hadn't forgotten; I was woken up in bedroom suite #3960 (which is where I am sleeping until they fix up the LoveNest bathroom properly) by the email thing going off with a new message. The macro substitution hadn't worked out quite right, but it was still Special. It said:

Dear <Employee First Name Tag>
Happy Birthday. We look forward to another year of excellent work from you.

Yours sincerely

<Friendly Line Manager Tag>

This message autogenerated by Microsoft Scheduler(TM) for Windows 95(R).

And to think most girls have to put up with flowers!

In the evening, I held a virtual dinner party to celebrate my birthday. I asked Steve Ballmer, and lots of other Microsoft guys along. They all had a big party in the Microsoft executive canteen, and I had supper in the ballroom which is a great room but feels a little lonesome by yourself. When the link came up I said Hi and Steve said Hi Melinda and I said Mrs William Gates III to you and we all laughed, which was nice.

Anyway, we ate and I had matzo balls and I said Isn't there any other part of the matzo you can eat? which is from Dinnerania™, the Microsoft CD-ROM of dinner party jokes. Only nobody laughed because

they were having pot roast and they couldn't see what I was having what with them being 20 miles away and when I tried to explain the link went down. Which was kind of sad because Dinnerania is in alpha and this is the only joke in the database and I had matzo balls special because as Bill always says, someone has got to do the alpha testing.

Friday

I have been going through some emotional pain this morning. Partially this is because, according to the house Newsnet system, Bill has had to go on to Red China, on account of them needing to be told how to use Microsoft Dictator™ for Windows for the Hong Kong project - I guess this must be our new voice recognition add-on for Office. Also I am still worrying about the joke in Dinnerania: what about all those dear little matzos that get hurt just so that persons can have dinner parties?

But mostly I am blue because the whole house crashed last night and when it came up again it had to go to its weekly backup security database which means it thinks I am in LoveNest when I am actually in bedroom suite #3960, which means I cannot open the door as I do not have correct security clearance. Also, there is no phone in here, as Bill thinks guests should be discouraged from using obsolete mainframe technology, and no windows, because the house is built under the hill, and as Bill says who needs windows in a room when you have got Windows®?

However, no need to worry! There is a terminal in here and I have emailed Bill to send help and look! I just got a reply. I just click on the little envelope and

Dear <Guest in bedroom suite #3960 Tag>

Thank you for your message. While Bill is always keen to hear from his guests, you will appreciate that he is a very busy man, and he can't always reply to his email straight away. Your patience is appreciated.

A few things you need for a great product launch...

DemoSHIELD™ is the only visual development tool for creating interactive demos and tutorials of your application for Microsoft® Windows®.

Create presales presentations... demonstrate your Windows software to potential customers without shipping the actual software. Create live application demos... effective tutorials that interactively teach your customers and potential customers how to use your product. Create application tutorials... sophisticated Computer Based Training and demonstration wizards to accompany your applications!

DemoSHIELD visual tools assist you in visually planning, creating and testing your demo or tutorial. Absolutely NO knowledge of C or any other programming language is needed. It's all point and click. It is totally VISUAL!

Show your application in action with DemoSHIELD, with Screen captures and .AVI files from your favorite source, and Live application macros created by DemoSHIELD. Add sound, text, graphics, or any interaction you want, with buttons, boxes, hot spots... Make your message hit the target! Add professional effects like fading text in and out... just use DemoSHIELD's unparalleled controls.

We thought of everything you'll need! A built in Setup Wizard (based on InstallSHIELD) assists you in seven easy push-button steps to create your installation. Anyone can watch your demo on any Windows PC with the highly efficient Demo Player, included with DemoSHIELD!

InstallSHIELD® is the full-featured installation toolkit for Microsoft® Windows®, Windows NT®, Windows 95® and OS/2, that enables you to build attractive, bullet-proof installations quickly and easily.

Want to see us in action? No problem. InstallSHIELD installations have been proven on millions of systems worldwide. No other tool is as widely used. In fact, thousands of commercial applications depend on InstallSHIELD to create flawless installations that keep end-users happy!

InstallSHIELD offers:

- Tools that let you build an internationally enabled installation for your app
- Professional installations in hours (no kidding!)
- Complete logic/flow control over your installation
- Three ready-to-customize sample templates
- Over 200 installation-smart features and functions
- Creates any custom dialog within the script
- Call any API directly from the script
- Powerful compression and file handling capabilities
- Modifies INI, CONFIG, and AUTOEXEC files
- Detects 50 user system parameters like CPU
- Animate bitmaps and use unlimited bitmaps
- Automatically adds program folder and icons
- Built-in graphical user feedback objects
- Includes 35 pre-built dialog boxes ready to customize
- Call DLLs from any source

DemoSHIELD and InstallSHIELD come with comprehensive documentation, compression, examples, and the finest technical support available.
